## Theory of Computation

## Course Outline

## Computability Theory 1930s - 1950s

- What is computable... or not?
- Examples:
program verification, mathematical truth
- Models of Computation:

Finite automata, Turing machines, ...

## Complexity Theory 1960s - present

- What is computable in practice?
- Example: factoring problem
- P versus NP problem
- Measures of complexity: Time and Space
- Models: Probabilistic and Interactive computation

## Course Mechanics

## Zoom Lectures

- Live and Interactive via Chat
- Live lectures are recorded for later viewing

## Zoom Recitations

- Not recorded
- Two convert to in-person
- Review concepts and more examples
- Optional unless you are having difficulty Participation can raise low grades
- Attend any recitation

## Text

- Introduction to the Theory of Computation Sipser, $3^{\text {rd }}$ Edition US. (Other editions ok but are missing some Exercises and Problems).

## Homework bi-weekly - 35\%

- More information to follow

Midterm (15\%) and Final exam (25\%)

- Open book and notes

Check-in quizzes for credit - 25\%

- Distinct Live and Recorded versions
- Complete either one for credit within 48 hours
- Initially ungraded; full credit for participation

## Course Expectations

## Prerequisites

Prior substantial experience and comfort with mathematical concepts, theorems, and proofs. Creativity will be needed for psets and exams.

## Collaboration policy on homework

- Allowed. But try problems yourself first.
- Write up your own solutions.
- No bibles or online materials.

## Role of Theory in Computer Science

1. Applications
2. Basic Research
3. Connections to other fields
4. What is the nature of computation?

## Let's begin: Finite Automata

States: $q_{1} q_{2} q_{3}$
Transitions: $\xrightarrow{1}$
Start state:

Accept states:

Input: finite string
Output: Accept or Reject
Computation process: Begin at start state, read input symbols, follow corresponding transitions, Accept if end with accept state, Reject if not.

Examples: $01101 \rightarrow$ Accept
$00101 \rightarrow$ Reject
$M_{1}$ accepts exactly those strings in $A$ where $A=\{w \mid w$ contains substring 11$\}$.

Say that $A$ is the language of $M_{1}$ and that $M_{1}$ recognizes $A$ and that $A=L\left(M_{1}\right)$.

## Finite Automata - Formal Definition

Defn: A finite automaton $M$ is a 5-tuple ( $\left.Q, \Sigma, \delta, q_{0}, F\right)$
$Q$ finite set of states
$\Sigma$ finite set of alphabet symbols
$\delta$ transition function $\delta: Q \times \Sigma \rightarrow Q$
$q_{0}$ start state

F set of accept states

## Example:

$$
\begin{aligned}
& M_{1}=\left(Q, \Sigma, \delta, q_{1}, F\right) \\
& Q=\left\{q_{1}, q_{2}, q_{3}\right\} \\
& \Sigma=\{0,1\} \\
& F=\left\{q_{3}\right\}
\end{aligned}
$$

## Finite Automata - Computation

## Strings and languages

- A string is a finite sequence of symbols in $\Sigma$
- A language is a set of strings (finite or infinite)
- The empty string $\varepsilon$ is the string of length 0
- The empty language $\varnothing$ is the set with no strings

## Recognizing languages

- $L(M)=\{w \mid M$ accepts $w\}$
- $L(M)$ is the language of $M$
- $M$ recognizes $L(M)$
if there is a sequence of states $r_{0}, r_{1}, r_{2}, \ldots, r_{n} \in Q$ where:
$-r_{0}=q_{0}$
- $r_{i}=\delta\left(r_{i-1}, w_{i}\right)$ for $1 \leq i \leq n$
- $r_{n} \in F$

Defn: A language is regular if some finite automaton recognizes it.

## Regular Languages - Examples

$L\left(M_{1}\right)=\{w \mid w$ contains substring 11 $\}=A$
Therefore $A$ is regular

## More examples:

Let $B=\{w \mid w$ has an even number of 1 s$\}$ $B$ is regular (make automaton for practice).

Let $C=\{w \mid w$ has equal numbers of 0 s and 1 s$\}$ $C$ is not regular (we will prove).

## Goal: Understand the regular languages

## Regular Expressions

Regular operations. Let $A, B$ be languages:

- Union: $\quad A \cup B=\{w \mid w \in A$ or $w \in B\}$
- Concatenation: $A \circ B=\{x y \mid x \in A$ and $y \in B\}=A B$
- Star: $\quad A^{*}=\left\{x_{1} \ldots x_{k} \mid\right.$ each $x_{i} \in A$ for $\left.k \geq 0\right\}$

Note: $\varepsilon \in A^{*}$ always

## Regular expressions

- Built from $\Sigma$, members $\Sigma, \emptyset, \varepsilon$ [Atomic]
- By using U,o,* [Composite]

## Examples:

- $\quad(0 \cup 1)^{*}=\Sigma^{*}$ gives all strings over $\Sigma$
- $\quad \sum^{*} 1$ gives all strings that end with 1
- $\quad \Sigma^{*} 11 \Sigma^{*}=$ all strings that contain $11=L\left(M_{1}\right)$

## Closure Properties for Regular Languages

Theorem: If $A_{1}, A_{2}$ are regularlanguages, so is $A_{1} \cup A_{2}$ (closure under U )
Proof: Let $M_{1}=\left(Q_{1}, \Sigma, \delta_{1}, q_{1}, F_{1}\right)$ recognize $A_{1}$ $M_{2}=\left(Q_{2}, \Sigma, \delta_{2}, q_{2}, F_{2}\right)$ recognize $A_{2}$
Construct $M=\left(Q, \Sigma, \delta, q_{0}, F\right)$ recognizing $A_{1} \cup A_{2}$
$M$ should accept input $w$ if either $M_{1}$ or $M_{2}$ accept $w$.

## Check-in 1.1

In the proof, if $M_{1}$ and $M_{2}$ are finite automata where $M_{1}$ has $k_{1}$ states and $M_{2}$ has $k_{2}$ states Then how many states does $M$ have?
(a) $k_{1}+k_{2}$
(b) $\left(k_{1}\right)^{2}+\left(k_{2}\right)^{2}$
(c) $k_{1} \times k_{2}$

## Components of $M$ :

$$
\begin{aligned}
& \imath=Q_{1} \times Q_{2} \\
&=\left\{\left(q_{1}, q_{2}\right) \mid q_{1} \in Q_{1} \text { and } q_{2} \in Q_{2}\right\} \\
& x_{0}=\left(q_{1}, q_{2}\right) \\
& s((q, r), a)=\left(\delta_{1}(q, a), \delta_{2}(r, a)\right) \\
& \vec{F}=F_{1} \wedge F_{2} \mathrm{NO}!\text { [gives intersection] } \\
& F=\left(F_{1} \times Q_{2}\right) \cup\left(Q_{1} \times F_{2}\right)
\end{aligned}
$$

## Closure Properties continued

Theorem: If $A_{1}, A_{2}$ are regular languages, so is $A_{1} A_{2}$ (closure under o)
Proof: Let $M_{1}=\left(Q_{1}, \Sigma, \delta_{1}, q_{1}, F_{1}\right)$ recognize $A_{1}$

$$
M_{2}=\left(Q_{2}, \Sigma, \delta_{2}, q_{2}, F_{2}\right) \text { recognize } A_{2}
$$

Construct $M=\left(Q, \Sigma, \delta, q_{0}, F\right)$ recognizing $A_{1} A_{2}$

$M$ should accept input w
if $w=x y$ where
$M_{1}$ accepts $x$ and $M_{2}$ accepts $y$.
