## ME 8693 HEAT AND MASS TRANSFER (L T P C-32 04 )

## OBJECTIVES:

- To understand the mechanisms of heat transfer under steady and transient conditions.
- To understand the concepts of heat transfer through extended surfaces.
- To learn the thermal analysis and sizing of heat exchangers and to understand the basic concepts of mass transfer.

## (Use of standard HMT data book permitted)

## UNIT I CONDUCTION

$9+6$
General Differential equation of Heat Conduction- Cartesian and Polar Coordinates - One Dimensional Steady State Heat Conduction - plane and Composite Systems - Conduction with Internal Heat Generation - Extended Surfaces - Unsteady Heat Conduction - Lumped Analysis - Semi Infinite and Infinite Solids -Use of Heisler's charts.

## UNIT II CONVECTION

Free and Forced Convection - Hydrodynamic and Thermal Boundary Layer. Free and Forced Convection during external flow over Plates and Cylinders and Internal flow through tubes .

## UNIT III PHASE CHANGE HEAT TRANSFER AND HEAT EXCHANGERS

Nusselt's theory of condensation - Regimes of Pool boiling and Flow boiling. Correlations in boiling and condensation. Heat Exchanger Types - Overall Heat Transfer Coefficient - Fouling Factors Analysis - LMTD method - NTU method.

## UNIT IV RADIATION

$9+6$
Black Body Radiation - Grey body radiation - Shape Factor - Electrical Analogy - Radiation Shields. Radiation through gases.

## UNIT V MASS TRANSFER

$9+6$
Basic Concepts - Diffusion Mass Transfer - Fick's Law of Diffusion - Steady state Molecular Diffusion - Convective Mass Transfer - Momentum, Heat and Mass Transfer Analogy -Convective Mass Transfer Correlations.

## TOTAL : 75 PERIODS

## OUTCOMES: Upon the completion of this course the students will be able to

CO1 Apply heat conduction equations to different surface configurations under steady state and transient conditions and solve problems
CO2 Apply free and forced convective heat transfer correlations to internal and external flows through/over various surface configurations and solve problems
CO3 Explain the phenomena of boiling and condensation, apply LMTD and NTU methods of thermal analysis to different types of heat exchanger configurations and solve problems
CO4 Explain basic laws for Radiation and apply these principles to radiative heat transfer between different types of surfaces to solve problems
CO5 Apply diffusive and convective mass transfer equations and correlations to solve problems for different applications

## UNIT I CONDUCTION

### 1.1 Heat

"Heat is defined as the transmission of energy from one region to another as a result of temperature gradient."

It is a vector quantity, flowing in the direction of decreasing temperature, with a negative temperature gradient. In the science of thermodynamics, the important parameter is the quantity of heat transferred during a process. Thermodynamics is concerned with the transition of a system from one equilibrium state to another, and is based principally on the two laws of nature, the first law of thermodynamics and second law of thermodynamics.

## The application of Heat transfer:

i) Design of thermal and nuclear power plants including heat engines, steam generators, condensers and other heat exchange equipments, catalytic converters, heat shields for space vehicles, furnaces, electronic equipments etc.
ii) Internal combustion engines
iii) Refrigeration and air conditioning units
iv) Design of cooling systems for electric motors, generators and transformers.
v) Heating and cooling of fluids.
vi) Construction of dams and structures.
vii) Heat treatment of metals.

## Modes of heat transfer:

Heat transfer takes places by the following three modes
i) Conduction
ii) Convection
iii) Radiation

## Conduction:-

Conduction is the transfer of heat from one part of a substance to another part of the same substance or from one substance to another in physical contact with it

Heat is conducted by

1. Atomic vibration
2. By transport of free electrons

## Fourier's law of heat conduction:-

The conduction heat transfer through a simple homogeneous solid is directly proportional to

1. The area of section at right angle to the direction of heat flow.
2. The change in temperature in between the two faces of the slab
3. Inversely proportional to the thickness of the slab.

Mathematically,
$Q \alpha A \frac{d T}{d x}$
$Q=$ Heat flow through a body per unit time(W)
$A=$ surface area of heat flow (Perpendicular to the direction of flow) $\mathrm{m}^{2}$
$\mathrm{dT}=$ Temperature difference of the faces of block ( ${ }^{\circ} \mathrm{C}$ or K )
$\mathrm{dx}=$ Thickness of body in the direction of flow (m)

$$
\mathrm{Q}=-\mathrm{KA} \frac{d T}{d x}
$$

$\mathrm{K}=$ thermal conductivity
-ve sign Kis to take care of the decreasing temperature along with the direction of increasing thickness or the direction of heat flow $\mathrm{dT} / \mathrm{dx}$ always -ve so Qis positive

## Thermal conductivity

The amount of energy conducted through a body of unit area, and unit thickness in unit time when the difference in temperature between the faces causing heat flow is unit temperature difference.

## Unit of thermal conductivity

$$
\begin{aligned}
\mathrm{K} & =\frac{Q}{A} \frac{d x}{d T} \\
& =\frac{W}{m^{2}} \frac{m}{K} \\
& =\frac{W}{m K}
\end{aligned}
$$

## Thermal resistance $\left(\mathrm{R}_{\mathrm{th}}\right)$

$$
\begin{aligned}
& \mathrm{Q}=\frac{d T}{\left(\frac{d x}{K A}\right)} \\
& \mathrm{Q}=\frac{d T}{R_{t h}}
\end{aligned}
$$

The quantity $\left(\frac{d x}{K A}\right)$ is called thermal conduction resistance

The reciprocal of the thermal resistance is called thermal conductance

Heat flux $\left(\frac{Q}{A}\right)$

It is defined as heat transfer per unit area is directly proportional to the change in temperature and inversely proportional to the thickness of the slab.

Unit is $\frac{W}{m^{2}}$

## Heat transfer by Convection

When fluid flows over a solid surface or inside a channel while temperature of the fluid and the solid surface are different. Heat transfer between the fluid and the solid surface takes place as a consequence of the motion of fluid relative to the surface. This mechanism of heat transfer is called convection

This convection is classified in to two types. They are,
i) Free convection
ii) Forced convection

## Newton's law of cooling:

The rate equation for the convective heat transfer between a surface and an adjacent fluid is prescribed by Newton's law of cooling.

$$
\mathrm{Q}=\mathrm{hA}\left(\mathrm{~T}_{s}-\mathrm{T}_{\mathrm{f}}\right)
$$

A = Area of exposed to heat transfer
$Q=$ Rate of convective heat transfer
$\mathrm{T}_{\mathrm{s}}=$ Surface Temperature.
$T_{f}=$ Fluid Temperature
$\mathrm{h}=$ Convective heat transfer co-efficient

## Convective heat transfer coefficient

The amount of heat transmitted for a unit temperature difference between the fluid and unit area of surface in unit time

## Unit of heat transfer coefficient

$$
\mathrm{h}=\mathrm{Q} / \mathrm{A}\left(\mathrm{~T}_{\mathrm{s}}-\mathrm{T}_{\mathrm{f}}\right)=\frac{W}{m K}
$$

## Heat transfer coefficient depends on the following factors:

i) Nature of fluid flow
ii) Geometry of the surface
iii) Viscosity of fluid
iv) Density of fluid

## Thermal resistance

$$
\begin{aligned}
& \mathrm{Q}=\frac{(\mathrm{Ts}-\mathrm{Tf})}{1 / \mathrm{hA}} \\
& \mathrm{Q}=\frac{(\mathrm{Ts}-\mathrm{Tf})}{R_{t h}}
\end{aligned}
$$

$\mathrm{R}_{\mathrm{th}}=$ Convective thermal resistance

## Heat transfer by Radiation:

The mode of heat transfer which continuously takes place without the necessity of intervening medium is called radiation. The most important example of thermal radiation is the transport of heat from the sun to the earth.

## Stefan-Boltzmann law :

The states that the emissive power of a black body is directly proportional to fourth power of its absolute temperature.

$$
\begin{aligned}
& Q \propto T^{4} \\
& Q=F \sigma A\left(T_{1}{ }^{4}-T_{2}{ }^{4}\right)
\end{aligned}
$$

$F=A$ factor depending on geometry and surface properties
$\sigma=$ Stefan-Boltzmann constant $=5.67 \times 10^{-8} \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}^{4}$
$A=$ Area $m^{2}$
$\mathrm{T}_{1}, \mathrm{~T}_{2}=$ higher temperature and lower temperature in K (or) C

## General heat conduction equation:-

Let us consider a small volume element of sides $d x, d y, a n d ~ d z ~ r e s p e c t i v e l y ~ t h r e e ~ a x e s ~ x, y, z . ~$

$\mathrm{T}=$ Temperature at the left face ABCD this temperature may be assumed uniform over the entire surface

$$
\frac{\partial T}{\partial x} \quad=\text { Temperature changes along } x \text { - direction }
$$

$$
\left(\frac{\partial T}{\partial x}\right) d x=\text { Change of temperature through distance } \mathrm{dx}
$$

$$
\mathrm{T}+\left(\frac{\partial T}{\partial x}\right) d x=\text { temperature on the right EFGH }
$$

$K_{x}, K_{y}, K_{z}=$ Thermal conductivities along $x, y, z$ axis
$q_{g}=$ heat generated per unit volume per unit time.

## Energy balance for volume element

Net heat accumulated in the element due to conduction of heat from all the co-ordinate direction (A) + heat generated with in the element $(B)=$ Energy stored in the element $(C)$

Heat flow Along $x$ - direction:-

```
dt = time interval
```

According to Fourier's Law

At left face

$$
\mathrm{Q}_{\mathrm{x}}=-\mathrm{K}_{\mathrm{x}}(\mathrm{dy} \mathrm{dx}) \frac{\partial T}{\partial x} \mathrm{dt}
$$

At right face

$$
\mathrm{Q}_{(x+d x)}=\mathrm{Q}_{\mathrm{x}}+\frac{\partial}{\partial x}(Q x) \mathrm{dx}
$$

Heat accumulated in $x$ - direction

$$
d Q_{x}=Q_{x}-Q_{(x+d x)}
$$

$$
=\mathrm{Q}_{\mathrm{x}}-\left(\mathrm{Q}_{\mathrm{x}}+\frac{\partial}{\partial x}(Q x) \mathrm{dx}\right)
$$

$$
=-\frac{\partial}{\partial x}(Q x) \mathrm{dx}
$$

$$
=-\frac{\partial}{\partial x}\left(-K_{x}(d y d x) \frac{\partial T}{\partial x} d t\right) d x
$$

$$
\begin{equation*}
\mathrm{dQ}_{\mathrm{x}} \quad=\mathrm{K}_{\mathrm{x}} \mathrm{dxdydx} \frac{\partial^{2} T}{\partial x^{2}} \mathrm{dt} \tag{1}
\end{equation*}
$$

Similarly along y-direction

$$
\begin{equation*}
\mathrm{dQ}_{y} \quad=\mathrm{K}_{\mathrm{y}} \mathrm{~d} x \mathrm{dydx} \frac{\partial^{2} T}{\partial y^{2}} \mathrm{dt} \tag{2}
\end{equation*}
$$

Similarly along z- direction

$$
\begin{equation*}
\mathrm{dQ}_{z}=\mathrm{K}_{\mathrm{z}} \mathrm{dxdydx} \frac{\partial^{2} T}{\partial z^{2}} \mathrm{dt} \tag{3}
\end{equation*}
$$

Net heat accumulated in the element due to conduction of heat from all the co-ordinates
A) $\Rightarrow(1)+(2)+(3)$
$\mathrm{K}_{\mathrm{x}} \mathrm{dxdydx} \frac{\partial^{2} T}{\partial x^{2}} \mathrm{dt}+\mathrm{K}_{\mathrm{y}} \mathrm{dxdydx} \frac{\partial^{2} T}{\partial y^{2}} \mathrm{dt}+\mathrm{K}_{\mathrm{z}} \mathrm{dxdydx} \frac{\partial^{2} T}{\partial z^{2}} \mathrm{dt}$

Heat generated with in the element (B)

$$
\begin{equation*}
\mathrm{Qg}=\mathrm{q}_{\mathrm{g}} \mathrm{dxdydz} . \mathrm{dt} \tag{B}
\end{equation*}
$$

Energy stored in the element (C)

$$
\begin{align*}
& \mathrm{Q}_{\mathrm{E}}=\mathrm{m} \times \mathrm{Cp} \times \text { (temperature difference) } \\
& \mathrm{Q}_{\mathrm{E}}=\rho \mathrm{V} \times \mathrm{Cp} \times \frac{\partial T}{\partial t} \mathrm{dt} \\
& \mathrm{Q}_{\mathrm{E}}=\rho(\mathrm{dxdydx}) \mathrm{Cp} \frac{\partial T}{\partial t} \mathrm{dt} \tag{C}
\end{align*}
$$

Energy balance equation

$$
\text { (A) }+(B)=(C)
$$

$\mathrm{K}_{\mathrm{x}} \mathrm{dxdydx} \frac{\partial^{2} T}{\partial x^{2}} \mathrm{dt}+\mathrm{K}_{\mathrm{y}} \mathrm{dx} \mathrm{dydx} \frac{\partial^{2} T}{\partial y^{2}} \mathrm{dt}+\mathrm{K}_{z} \mathrm{dxdydx} \frac{\partial^{2} T}{\partial z^{2}} \mathrm{dt}+\mathrm{q}_{\mathrm{g}} \mathrm{dxdydz} . \mathrm{dt}=\rho(\mathrm{dxdydx}) \mathrm{Cp} \frac{\partial T}{\partial t} \mathrm{dt}$
$K_{x}=K_{y}=K_{z}$ (For isotropic material and homogeneous material )

$$
\begin{align*}
& \mathrm{K}\left(\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}+\frac{\partial^{2} T}{\partial z^{2}}+\mathrm{q}_{\mathrm{g}}\right) \quad \\
& \begin{array}{l}
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}+\frac{\partial T}{\partial t} \\
\partial z^{2}
\end{array}+\frac{\partial^{2} T}{\mathrm{~K}}=\frac{\rho \mathrm{Cp}}{K} \frac{\partial T}{\partial t}  \tag{4}\\
& \alpha=\frac{\mathrm{K}}{\rho \mathrm{Cp}} \quad\left[\alpha=\text { Thermal Diffusivity }=\frac{\text { Thermal conductivi ty }}{\text { Thermal Capacity }}\right]
\end{align*}
$$

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}+\frac{\partial^{2} T}{\partial z^{2}}+\frac{\mathrm{q}_{\mathrm{g}}}{\mathrm{~K}}=\frac{1}{\alpha} \frac{\partial T}{\partial t}
$$

The above equation is called "general heat conduction equation for unsteady state three dimensional with internal heat generation"

Steady state, $\frac{\partial T}{\partial t}=0$

1) Three dimensional steady state heat conduction equation with out heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}+\frac{\partial^{2} T}{\partial z^{2}}=0
$$

This equation is called Laplace equation
2) Three dimensional steady state heat conduction equation with heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}+\frac{\partial^{2} T}{\partial z^{2}}+\frac{\mathrm{q}_{\mathrm{g}}}{\mathrm{~K}}=0
$$

3) Three dimensional Unsteady state heat conduction equation with out heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}+\frac{\partial^{2} T}{\partial z^{2}}=\frac{1}{\alpha} \frac{\partial T}{\partial t}
$$

## This equation is called Fourier's equation

4) Two dimensional steady state heat conduction equation with out heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}=0
$$

5) Two dimensional steady state heat conduction equation with heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}=0
$$

6) Two dimensional steady state heat conduction equation with heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\partial^{2} T}{\partial y^{2}}+\frac{\mathrm{q}_{\mathrm{g}}}{\mathrm{~K}}=0
$$

7) One dimensional Unsteady state heat conduction equation with heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\mathrm{q}_{\mathrm{g}}}{\mathrm{~K}}=\frac{1}{\alpha} \frac{\partial T}{\partial t}
$$

8) One dimensional steady state heat conduction equation with heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}+\frac{\mathrm{q}_{\mathrm{g}}}{\mathrm{~K}}=0
$$

9) One dimensional steady state heat conduction equation with out heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}=0
$$

10) One dimensional Unsteady state heat conduction equation with out heat generation

$$
\frac{\partial^{2} T}{\partial x^{2}}=\frac{1}{\alpha} \frac{\partial T}{\partial t}
$$

## General heat conduction in cylindrical co-ordinates:-

The volume of element $=r d \phi . d r . d z$

## Energy balance equation

Net heat accumulated in the element due to conduction of heat from all the co-ordinate direction (A) + heat generated with in the element $(B)=$ Energy stored in the element $(C)$
A)

Heat flow in radial direction ( $x-\phi$ plane)

According to Fourier's Law

At left face

$$
\mathrm{Q}_{\mathrm{r}} \quad=-\mathrm{K}(\mathrm{rd} \phi \mathrm{dz}) \frac{\partial T}{\partial r} \mathrm{dt}
$$

At right face

$$
\mathrm{Q}_{(r+d r)}=\mathrm{Q}_{r}+\frac{\partial}{\partial r}(Q r) \mathrm{dr}
$$

Heat accumulated in r-direction

$$
\begin{aligned}
\mathrm{dQ}_{r} & =\mathrm{Q}_{r}-\mathrm{Q}_{(r+d r)} \\
& =\mathrm{Q}_{r}-\left(\mathrm{Q}_{r}+\frac{\partial}{\partial r}(Q r) \mathrm{dr}\right) \\
& =-\frac{\partial}{\partial r}(Q r) \mathrm{dr} \\
& =-\frac{\partial}{\partial r}\left(-\mathrm{K}(\mathrm{rd} \phi \mathrm{dz}) \frac{\partial T}{\partial r} \mathrm{dt}\right) \mathrm{dr} \\
& =\mathrm{K}(\mathrm{dr} \mathrm{~d} \phi \mathrm{dz}) \frac{\partial}{\partial r}\left(r \frac{\partial T}{\partial r}\right) \mathrm{dt}
\end{aligned}
$$

$$
\begin{align*}
& =\mathrm{K}(\mathrm{drd} \phi \mathrm{dz})\left(\frac{\partial^{2} T}{\partial r^{2}}+\frac{\partial T}{\partial r}\right) \mathrm{dt} \\
\mathrm{dQ}_{r} \quad & =\mathrm{K}(\mathrm{dr} \mathrm{rd} \phi \mathrm{dz})\left(\frac{\partial^{2} T}{\partial r^{2}}+\frac{1}{r} \frac{\partial T}{\partial r}\right) \mathrm{dt} \tag{1}
\end{align*}
$$

Heat flow in angular direction

$$
\begin{gathered}
\mathrm{Q} \phi \quad=-\mathrm{K}(\mathrm{dr} . \mathrm{dz}) \frac{\partial T}{r \partial \phi} \mathrm{dt} \\
\mathrm{Q}_{( }(\phi+\mathrm{d} \phi)=\mathrm{Q} \phi+\frac{\partial}{r \partial \phi}(\mathrm{Q} \phi, \mathrm{r} . \mathrm{d} \phi
\end{gathered}
$$

Heat accumulated

$$
\begin{align*}
\mathrm{dQ} \phi= & \left.\mathrm{Q} \phi-\mathrm{Q}_{( } \phi+\mathrm{d} \phi\right) \\
& =-\frac{\partial}{r \partial \phi}(\mathrm{Q} \phi) \mathrm{r} \cdot \mathrm{~d} \phi \\
& =-\frac{\partial}{r \partial \phi}\left(-\mathrm{K}(\mathrm{dr} . \mathrm{dz}) \frac{\partial T}{r \partial \phi} \mathrm{dt}\right) \cdot \mathrm{r} \cdot \mathrm{~d} \phi \\
\mathrm{dQ} \phi \quad & =\mathrm{K}(\mathrm{dr} \cdot \mathrm{rd} \phi \cdot \mathrm{dz}) \frac{1}{r^{2}} \frac{\partial^{2} T}{\partial \phi^{2}} \mathrm{dt} \tag{2}
\end{align*}
$$

Heat flow in Z direction ( $r-\phi$ ) plane

$$
\begin{gathered}
\mathrm{Q}_{z}=-\mathrm{K}(\mathrm{dr} \cdot \mathrm{rd} \phi) \frac{\partial T}{\partial z} \mathrm{dt} \\
\mathrm{Q}_{(z+\mathrm{d} z)} \quad=\mathrm{Q}_{z}+\frac{\partial}{\partial z}(Q z) \mathrm{d} z
\end{gathered}
$$

$$
\begin{aligned}
& \mathrm{dQ}_{z}=\mathrm{Q}_{z}-\mathrm{Q}_{(z+\mathrm{dz})} \\
&=-\frac{\partial}{\partial z}\left(Q_{z}\right) \mathrm{dz} \\
&=-\frac{\partial}{\partial z}\left(-\mathrm{K}(\mathrm{dr} . \mathrm{rd} \phi) \frac{\partial T}{\partial z} \mathrm{dt}\right) \mathrm{dz} \\
& \mathrm{dQ}_{z} \quad=\mathrm{K}(\mathrm{dr} . \mathrm{rd} \phi \cdot \mathrm{dz}) \frac{\partial^{2} T}{\partial z^{2}} \mathrm{dt}
\end{aligned}
$$

Net heat accumulated in the element due to conduction of heat from all the co-ordinate direction
A) $\Rightarrow(1)+(2)+(3)$

K(dr rd $\phi \mathrm{dz})\left(\frac{\partial^{2} T}{\partial r^{2}}+\frac{1}{r} \frac{\partial T}{\partial r}\right) \mathrm{dt}+\mathrm{K}(\mathrm{dr} . \mathrm{rd} \phi \mathrm{dz}) \frac{1}{r^{2}} \frac{\partial^{2} T}{\partial \phi^{2}} \mathrm{dt}+\mathrm{K}(\mathrm{dr} . \mathrm{rd} \phi . \mathrm{dz}) \frac{\partial^{2} T}{\partial z^{2}} \mathrm{dt}-\ldots-----(\mathrm{A})$

Heat generated with in the element (B)

$$
\begin{equation*}
\mathrm{Q}_{\mathrm{g}} \quad=\mathrm{q}_{\mathrm{g}}(\mathrm{dr} \cdot \mathrm{rd} \phi \cdot \mathrm{dz}) \cdot \mathrm{dt} \tag{B}
\end{equation*}
$$

Energy stored in the element (C)

$$
\begin{align*}
& \mathrm{Q}_{\mathrm{E}}=\mathrm{m} \times \mathrm{Cp} \times(\text { temperature difference }) \\
& \mathrm{Q}_{\mathrm{E}} \quad=\rho \mathrm{V} \times \mathrm{Cp} \times \frac{\partial T}{\partial t} \mathrm{dt} \\
& \mathrm{Q}_{\mathrm{E}}=\rho(\mathrm{dr} . \mathrm{rd} \phi \cdot \mathrm{dz}) \mathrm{Cp} \frac{\partial T}{\partial t} \mathrm{dt} \tag{C}
\end{align*}
$$

## Energy balance equation

(A) $+(B)=(C)$
$\mathrm{K}(\mathrm{dr} \mathrm{rd} \phi \mathrm{dz})\left(\frac{\partial^{2} T}{\partial r^{2}}+\frac{1}{r} \frac{\partial T}{\partial r}\right) \mathrm{dt}+\mathrm{K}(\mathrm{dr} . \mathrm{rd} \phi \cdot \mathrm{dz}) \frac{1}{r^{2}} \frac{\partial^{2} T}{\partial \phi^{2}} \mathrm{dt}+\mathrm{K}(\mathrm{dr} . \mathrm{rd} \phi \cdot \mathrm{dz}) \frac{\partial^{2} T}{\partial z^{2}} \mathrm{dt}+\mathrm{q}_{\mathrm{g}}(\mathrm{dr} \cdot \mathrm{rd} \phi \cdot \mathrm{dz}) \cdot \mathrm{dt}$

$$
\begin{aligned}
& =\rho(\mathrm{dr} \cdot \mathrm{rd} \phi \cdot \mathrm{dz}) \mathrm{Cp} \frac{\partial T}{\partial t} \mathrm{dt} \\
\left.\mathrm{~K}\left(\frac{\partial^{2} T}{\partial r^{2}}+\frac{1}{r} \frac{\partial T}{\partial r}\right)+\frac{1}{r^{2}} \frac{\partial^{2} T}{\partial \phi^{2}}+\frac{\partial^{2} T}{\partial z^{2}}\right)+\mathrm{q}_{\mathrm{g}}= & \rho \mathrm{Cp} \frac{\partial T}{\partial t} \\
\frac{\partial^{2} T}{\partial r^{2}}+\frac{1}{r} \frac{\partial T}{\partial r}+\frac{1}{r^{2}} \frac{\partial^{2} T}{\partial \phi^{2}}+\frac{\partial^{2} T}{\partial z^{2}}+\frac{\mathrm{q}_{\mathrm{g}}}{\mathrm{~K}} & =\frac{\rho \mathrm{Cp}}{K} \frac{\partial T}{\partial t} \\
\frac{\partial^{2} T}{\partial r^{2}}+\frac{1}{r} \frac{\partial T}{\partial r}+\frac{1}{r^{2}} \frac{\partial^{2} T}{\partial \phi^{2}}+\frac{\partial^{2} T}{\partial z^{2}}+\frac{\mathrm{q}_{\mathrm{g}}}{\mathrm{~K}} & =\frac{1}{\alpha} \frac{\partial T}{\partial t}
\end{aligned}
$$

The above equation is called "general heat conduction equation for unsteady state three dimensional with internal heat generation" in cylindrical coordinate system

## General heat conduction in spherical coordinate system:-

$\frac{1}{r^{2} \sin ^{2} \theta} \frac{\partial^{2} T}{\partial \Phi^{2}}+\frac{1}{r^{2} \sin \theta} \frac{\partial}{\partial \theta}\left(\sin \theta . \frac{\partial T}{\partial \theta}\right)+\frac{1}{r^{2}} \frac{\partial}{\partial r}\left(r^{2} \frac{\partial T}{\partial r}\right)+\frac{\mathrm{q}_{\mathrm{g}}}{\mathrm{K}}=\frac{1}{\alpha} \frac{\partial T}{\partial t}$

One dimensional heat flow:-

## Heat conduction through a plane wall:

Consider a plane wall of homogeneous material which heat is flowing only in $x$-direction
$\mathrm{L}=$ thickness of the plane wall
$A=$ Cross sectional area of the wall
$\mathrm{K}=$ thermal conductivity of the wall material
$\mathrm{T}_{1}, \mathrm{~T} 2=$ Temperature maintained at two faces.

At $\mathrm{x}=0 \quad \mathrm{~T}=\mathrm{T}_{1}$ (Initial condition)

At $\mathrm{x}=\mathrm{L} \quad \mathrm{T}=\mathrm{T}_{2}$ (Boundary Condition)

One dimensional steady state without heat generation

$$
\begin{aligned}
& \frac{\partial^{2} T}{\partial x^{2}}=0 \\
& \text { (Or) } \\
& \frac{d^{2} T}{d x^{2}}=0
\end{aligned}
$$

By integrating the above equation twice

$$
\begin{align*}
& \frac{d T}{d x}=\mathrm{C} 1 \\
& \mathrm{~T}=\mathrm{C}_{1} x+\mathrm{C}_{2} \tag{a}
\end{align*}
$$

Appling initial condition

$$
\mathrm{C}_{2}=\mathrm{T}_{1}
$$

Appling boundary condition

$$
\mathrm{T}_{2}=\mathrm{C} 1(\mathrm{~L})+\mathrm{C}_{2}
$$

$$
\mathrm{C}_{1}=\frac{T_{2}-T_{1}}{L}
$$

$\mathrm{C}_{1} \& \mathrm{C}_{2}$ values substitute in equation (a)

$$
\mathrm{T} \quad=\left(\frac{T_{2}-T_{1}}{L}\right) x+\mathrm{T}_{1}
$$

According to Fourier's Law

$$
\begin{aligned}
\mathrm{Q} & =-\mathrm{KA} \frac{\partial T}{\partial x} \\
& =-\mathrm{KA} \frac{\partial}{\partial x}\left[\left(\frac{T_{2}-T_{1}}{L}\right) x+\mathrm{T}_{1}\right] \\
& =-\mathrm{KA}\left(\frac{T_{2}-T_{1}}{L}\right) \\
\mathrm{Q} & =\mathrm{KA}\left(\frac{T_{1}-T_{2}}{L}\right) \\
\mathrm{Q} & \left.=\frac{T_{1}-T_{2}}{(L / K A}\right) \\
\mathrm{Q} & =\frac{T_{1}-T_{2}}{\left(R_{t h}\right)_{\text {cond }}}
\end{aligned}
$$

## Heat conduction through a plane wall:

Consider A, Band C composite wall

$$
\begin{aligned}
& \mathrm{L}_{A}, \mathrm{~L}_{B}, \mathrm{~L}_{\mathrm{C}} \quad=\text { thickness of slabs } \mathrm{A}, \text { Band } \mathrm{C} \text { respectively, } \\
& \mathrm{K}_{A}, \mathrm{~K}_{B}, \mathrm{~K}_{\mathrm{C}} \quad=\text { Thermal conductivities of the slabs A,BandC respectively, }
\end{aligned}
$$

$\mathrm{T}_{1}, \mathrm{~T}_{4}=$ Temperature at the wall surface 1 and 4 respectively,
$\mathrm{T}_{2}, \mathrm{~T}_{3}=$ Temperature at the interface 2 and 3 respectively

Perfect contact between layers so no temperature drop.

$$
\begin{align*}
& \mathrm{Q}=\mathrm{K}_{\mathrm{A}} \mathrm{~A}\left(\frac{T_{1}-T_{2}}{L_{A}}\right)=\mathrm{K}_{\mathrm{B}} \mathrm{~A}\left(\frac{T_{2}-T_{3}}{L_{B}}\right)=\mathrm{K}_{\mathrm{C}} \mathrm{~A}\left(\frac{T_{3}-T_{4}}{L_{C}}\right) \\
& \mathrm{T}_{1}-\mathrm{T}_{2}=\frac{Q L_{A}}{K_{A} A}  \tag{i}\\
& \mathrm{~T}_{2}-\mathrm{T}_{3}=\frac{Q L_{B}}{K_{B} A}  \tag{ii}\\
& \mathrm{~T}_{3}-\mathrm{T}_{4}=\frac{Q L_{C}}{K_{C} A} \tag{ii}
\end{align*}
$$

By adding equation (i),(ii),(iii)

$$
\begin{aligned}
& \mathrm{T}_{1}-\mathrm{T}_{4}=\frac{Q L_{A}}{K_{A} A}+\frac{Q L_{B}}{K_{B} A}+\frac{Q L_{C}}{K_{C} A} \\
& \mathrm{~T}_{1}-\mathrm{T}_{4}=\mathrm{Q}\left[\frac{L_{A}}{K_{A} A}+\frac{L_{B}}{K_{B} A}+\frac{L_{C}}{K_{C} A}\right]
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{Q}=\frac{T_{1}-T_{4}}{\frac{L_{A}}{K_{A} A}+\frac{L_{B}}{K_{B} A}+\frac{L_{C}}{K_{C} A}} \\
& \mathrm{Q}=\frac{T_{1}-T_{4}}{R_{A}+R_{B}+R_{C}}
\end{aligned}
$$

Heat Flux(Q/A)

$$
\frac{Q}{A}=\frac{T_{1}-T_{4}}{\frac{L_{A}}{K_{A}}+\frac{L_{B}}{K_{B}}+\frac{L_{C}}{K_{C}}}\left(\frac{W}{m^{2}}\right)
$$

Composite wall ' $n$ ' layers,

$$
\begin{aligned}
& \mathrm{Q}=\frac{T_{1}-T_{n+1}}{\sum_{n=1}^{n} \frac{L}{K A}} \\
& \mathrm{Q}=\frac{(\Delta T)_{\text {Overall }}}{\sum R}
\end{aligned}
$$

## The overall heat transfer coefficient

While dealing with the problems of fluid to fluid heat transfer across a metal boundary, it is usual to adopt an overall heat transfer coefficient $U$ which gives the heat transmitted per unit area per unit time per degree temperature different between the bulk fluids on each side of the metal.

$$
\begin{align*}
& \mathrm{Q}=\mathrm{h}_{\mathrm{hf}} \mathrm{~A}\left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{1}\right)=\mathrm{KA}\left(\frac{T_{1}-T_{2}}{L}\right)=\mathrm{h}_{\mathrm{cf}} \mathrm{~A}\left(\mathrm{~T}_{2}-\mathrm{T}_{\mathrm{cf}}\right) \\
& \mathrm{T}_{\mathrm{hf}}-\mathrm{T}_{1} \quad=\frac{Q}{h_{h f} A}  \tag{i}\\
& \mathrm{~T}_{1}-\mathrm{T}_{2}=\frac{Q L}{K A} \tag{ii}
\end{align*}
$$

$$
\begin{equation*}
\mathrm{T}_{2}-\mathrm{T}_{\mathrm{cf}}=\frac{Q}{h_{C f} A} \tag{ii}
\end{equation*}
$$

By adding equation (i),(ii),(iii)

$$
\left.\begin{array}{rl}
\mathrm{T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}} & =\frac{Q}{h_{h f} A}+\frac{Q L}{K A}+\frac{Q}{h_{C f} A} \\
\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}} & =\mathrm{Q}\left[\frac{1}{h_{h f A} A}+\frac{L}{K A}+\frac{1}{h_{C f} A}\right] \\
\mathrm{Q} & =\frac{T_{h f}-T_{c f}}{\frac{1}{h_{h f} A}+\frac{L}{K A}+\frac{1}{h_{C f} A}} \\
\mathrm{Q} & =\frac{T_{h f}-T_{c f}}{R_{1}+R_{2}+R_{3}} \\
\mathrm{Q} & =\frac{A\left(T_{h f}-T_{c f}\right)}{\frac{1}{h_{h f}}+\frac{L}{K}+\frac{1}{h_{C f}}} \\
\mathrm{Q} & =\mathrm{U}_{0} \mathrm{~A}\left(\mathrm{~T}_{\mathrm{hf}} \mathrm{~T} \mathrm{~T}_{\mathrm{cf}}\right.
\end{array}\right] \begin{aligned}
& \mathrm{U}_{\mathrm{o}}=\frac{1}{\frac{1}{h_{h f}}+\frac{L}{K}+\frac{1}{h_{C f}}}
\end{aligned}
$$

$U_{0}=$ Overall heat transfer coefficient

## Heat conduction through hollow cylinder:-

Consider a hollow cylinder of homogeneous material which heat is flowing only in radial direction
$L=$ length of the cylinder wall
$A=$ Cross sectional area of the cylinder
$\mathrm{K}=$ thermal conductivity of the wall material
$\mathrm{T}_{1}, \mathrm{~T} 2=$ Temperature maintained at two faces.

At $r=\mathrm{r}_{1} \quad \mathrm{~T}=\mathrm{T}_{1}$ (Initial condition)

At $r=r_{2} \quad T=T_{2}$ (Boundary Condition)

One dimensional steady state without heat generation

$$
\frac{\partial^{2} T}{\partial r^{2}}+\frac{1}{r} \frac{\partial T}{\partial r}=0
$$

(Or)

$$
\frac{d^{2} T}{d r^{2}}+\frac{1}{r} \frac{d T}{d r}=0
$$

By integrating the above equation twice

$$
\begin{aligned}
\frac{1}{r}\left[\frac{d}{d r}\left(r \frac{d T}{d r}\right)\right] & =0 \\
\frac{1}{r} \neq 0 \therefore \frac{d}{d r}\left(r \frac{d T}{d r}\right) & =0 \\
r \frac{d T}{d r} & =\mathrm{C}_{1} \\
\frac{d T}{d r} & =\frac{C_{1}}{r}
\end{aligned}
$$

$$
T=C_{1} \ln (r)+C_{2}
$$

Appling initial condition

$$
\begin{equation*}
\mathrm{T}_{1}=\mathrm{C}_{1} \ln \left(\mathrm{r}_{1}\right)+\mathrm{C}_{2} \tag{1}
\end{equation*}
$$

Appling boundary condition

$$
\begin{equation*}
T_{2}=C_{1} \ln \left(r_{2}\right)+C_{2} \tag{2}
\end{equation*}
$$

By subtracting equation (1) and (2)

$$
\mathrm{C}_{1}=\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)}
$$

Substitute $C_{1}$ value in equation (1)

$$
\begin{array}{ll}
\mathrm{T}_{1} & =\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)} \ln \left(\mathrm{r}_{1}\right)+\mathrm{C}_{2} \\
\mathrm{C}_{2} & =\mathrm{T}_{1}-\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)} \ln \left(\mathrm{r}_{1}\right)
\end{array}
$$

Substitute $C_{1} \& C_{2}$ value in equation (A)

$$
\begin{aligned}
& \mathrm{T}=\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)} \ln (\mathrm{r})+\mathrm{T}_{1}-\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)} \ln \left(\mathrm{r}_{1}\right) \\
& \mathrm{T}=\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)}\left[\ln (\mathrm{r})-\ln \left(\mathrm{r}_{1}\right)\right]+\mathrm{T}_{1}
\end{aligned}
$$

$$
\mathrm{T}=\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)}\left[\ln \left(\frac{r}{r_{1}}\right)\right]+\mathrm{T}_{1}
$$

According Fourier's Law

$$
\begin{aligned}
& \mathrm{Q}=-\mathrm{KA} \frac{\partial T}{\partial r} \\
& \mathrm{Q}=-\mathrm{KA} \frac{\partial}{\partial r}\left[\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)}\left[\ln \left(\frac{r}{r_{1}}\right)\right]+\mathrm{T}_{1}\right] \\
& \mathrm{Q}=-\mathrm{KA} \frac{T_{1}-T_{2}}{\ln \left(\frac{r_{1}}{r_{2}}\right)}\left(\frac{r_{1}}{r}\right)\left(\frac{1}{r_{1}}\right) \\
& \mathrm{Q}=\text { KA } \frac{T_{1}-T_{2}}{\ln \left(\frac{r_{2}}{r_{1}}\right)}\left(\frac{1}{r}\right)
\end{aligned}
$$

$A=2 \pi r L$ (Surface Area of the Cylinder)

$$
\mathrm{Q}=\mathrm{K}(2 \pi \mathrm{r} \mathrm{~L}) \frac{T_{1}-T_{2}}{\ln \left(\frac{r_{2}}{r_{1}}\right)}\left(\frac{1}{r}\right)
$$

$$
\mathrm{Q}=2 \pi \mathrm{KL} \frac{T_{1}-T_{2}}{\ln \left(\frac{r_{2}}{r_{1}}\right)}
$$

$$
\mathrm{Q}=\frac{T_{1}-T_{2}}{\ln \left(\frac{r_{2}}{r_{1}}\right) / 2 \pi K L}
$$

$$
\mathrm{Q}=\frac{T_{1}-T_{2}}{R}
$$

Thermal resistance $\mathrm{R}=\frac{\ln \left(\frac{r_{2}}{r_{1}}\right)}{2 \pi K L}$

## Heat conduction thorough a composite cylinder:-

Consider Inside and out side convection.
$\mathrm{Q}=h_{h f} \mathrm{~A}_{\mathrm{i}}\left(\mathrm{T}_{\text {hf }}-\mathrm{T}_{1}\right)=2 \pi \mathrm{~K}_{\mathrm{A}} \mathrm{L} \frac{T_{1}-T_{2}}{\ln \left(\frac{r_{2}}{r_{1}}\right)}=2 \pi \mathrm{~K}_{\mathrm{B}} \mathrm{L} \frac{T_{2}-T_{3}}{\ln \left(\frac{r_{3}}{r_{2}}\right)}=\mathrm{h}_{\mathrm{cf}} \mathrm{A}_{\mathrm{o}}\left(\mathrm{T}_{3}-\mathrm{T}_{\mathrm{cf}}\right)$
$A_{i}$ and $A_{o}$ are inside and outside surface area,
$\begin{aligned} \mathrm{Q}=\mathrm{h}_{\mathrm{hf}}\left(2 \pi \mathrm{r}_{1} \mathrm{~L}\right)\left(\mathrm{T}_{\mathrm{hf}}-\mathrm{T}_{1}\right) & =2 \pi \mathrm{~K}_{\mathrm{A}} \mathrm{L} \frac{T_{1}-T_{2}}{\ln \left(\frac{r_{2}}{r_{1}}\right)}=2 \pi \mathrm{~K}_{\mathrm{B}} \mathrm{L} \frac{T_{2}-T_{3}}{\ln \left(\frac{r_{3}}{r_{2}}\right)}=\mathrm{h}_{\mathrm{cf}}\left(2 \pi \mathrm{r}_{3} \mathrm{~L}\right)\left(\mathrm{T}_{3}-\mathrm{T}_{\mathrm{cf}}\right) \\ \mathrm{Thf} \mathrm{T}_{1} & =\frac{Q}{h_{h f} 2 \pi r_{1} L}\end{aligned}$

$$
\begin{equation*}
\mathrm{T}_{1}-\mathrm{T}_{2}=\frac{Q \ln \left(\frac{r_{2}}{r_{1}}\right)}{2 \pi K_{A} L} \tag{ii}
\end{equation*}
$$

$$
\begin{equation*}
\mathrm{T}_{2}-\mathrm{T}_{3}=\frac{Q \ln \left(\frac{r_{3}}{r_{2}}\right)}{2 \pi K_{B} L} \tag{iii}
\end{equation*}
$$

$$
\begin{equation*}
\mathrm{T}_{3}-\mathrm{T}_{\mathrm{cf}}=\frac{Q}{h_{C f} 2 \pi r_{3} L} \tag{iv}
\end{equation*}
$$

By adding equations

$$
\begin{aligned}
& \left(\mathrm{T}_{\text {hf }}-\mathrm{T}_{\mathrm{cf}}\right)=\frac{Q}{h_{h f} 2 \pi r_{1} L}+\frac{Q \ln \left(\frac{r_{2}}{r_{1}}\right)}{2 \pi K_{A} L}+\frac{Q \ln \left(\frac{r_{3}}{r_{2}}\right)}{2 \pi K_{B} L}+\frac{Q}{h_{C f} 2 \pi r_{3} L} \\
& \left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)=\mathrm{Q}\left[\frac{1}{h_{h f} 2 \pi r_{1} L}+\frac{\ln \left(\frac{r_{2}}{r_{1}}\right)}{2 \pi K_{A} L}+\frac{\ln \left(\frac{r_{3}}{r_{2}}\right)}{2 \pi K_{B} L}+\frac{1}{h_{C f} 2 \pi r_{3} L}\right] \\
& \mathrm{Q}=\left(\mathrm{T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right) /\left[\frac{1}{h_{h f} 2 \pi r_{1} L}+\frac{\ln \left(\frac{r_{2}}{r_{1}}\right)}{2 \pi K_{A} L}+\frac{\ln \left(\frac{r_{3}}{r_{2}}\right)}{2 \pi K_{B} L}+\frac{1}{h_{C f} 2 \pi r_{3} L}\right] \\
& \left.\mathrm{Q}=\frac{T_{h f}-T_{c f}}{\frac{\ln \frac{r_{2}}{r_{1}}}{\frac{1}{h_{h f} 2 \pi r_{1} L}+\frac{r_{3}}{r_{2}}} 2 \pi K_{A} L}+\frac{1}{2 \pi K_{B} L}+\frac{1}{h_{C f} 2 \pi r_{3} L}\right) \\
& \left.\mathrm{Q}=\frac{2 \pi L\left(T_{h f}-T_{c f}\right)}{\ln \frac{r_{2}}{r_{1}}+\frac{r_{3}}{h_{2}} r_{1}}+\frac{1}{K_{A}}+\frac{1}{K_{C f} r_{3}}\right)
\end{aligned}
$$

Add $r_{1}$ in denominator and numerator

$$
\begin{aligned}
& \mathrm{Q}=\frac{2 \pi r_{1} L\left(T_{h f}-T_{c f}\right)}{\frac{1}{h_{h f}}+\frac{r_{1} \ln \frac{r_{2}}{r_{1}}}{K_{A}}+\frac{r_{1} \ln \frac{r_{3}}{r_{2}}}{K_{B}}+\frac{r_{1}}{h_{C f} r_{3}}} \\
& \mathbf{Q}=\frac{A_{i}\left(T_{h f}-T_{c f}\right)}{\frac{r_{1} \ln \frac{r_{2}}{r_{1}}}{r_{1} \ln \frac{r_{3}}{r_{2}}}+\frac{r_{1}}{K_{h f}}}+
\end{aligned}
$$

We know,
$\mathrm{Q}=\mathrm{U}_{\mathrm{i}} A_{i}\left(T_{h f}-T_{c f}\right)$
$U_{i}=$ Over all heat transfer coefficient based on inner side
$\mathrm{U}_{\mathrm{i}}=\frac{1}{h_{h f}}+\frac{r_{1}}{K_{A}} \ln \left(\frac{r_{2}}{r_{1}}\right)+\frac{r_{1}}{K_{B}} \ln \left(\frac{r_{3}}{r_{2}}\right)+\frac{r_{1}}{h_{C f} r_{3}}$

Add $r_{3}$ in denominator and numerator

$$
\begin{aligned}
& \mathrm{Q}=\frac{2 \pi r_{3} L\left(T_{h f}-T_{c f}\right)}{\frac{r_{3} \ln \frac{r_{2}}{r_{1}}}{h_{h f}}+\frac{r_{3} \ln \frac{r_{3}}{r_{2}}}{K_{A}}+\frac{1}{K_{B}}+\frac{h_{C f}}{h_{o}\left(T_{h f}-T_{c f}\right)}} \\
& \mathbf{Q}=\frac{r_{3} \ln \frac{r_{2}}{r_{1}}}{\frac{r_{3} \ln \frac{r_{3}}{r_{2}}}{h_{h f}}+\frac{1}{K_{B}}+\frac{1}{h_{C f}}}
\end{aligned}
$$

We know,

$$
\mathrm{Q}=\mathrm{U}_{0} A_{o}\left(T_{h f}-T_{c f}\right)
$$

$\mathrm{U}_{0}=$ Over all heat transfer coefficient based on outer side

$$
\mathrm{U}_{0}=\frac{r_{3}}{h_{h f} r_{1}}+\frac{r_{3}}{K_{A}} \ln \left(\frac{r_{2}}{r_{1}}\right)+\frac{r_{3}}{K_{B}} \ln \left(\frac{r_{3}}{r_{2}}\right)+\frac{1}{h_{C f}}
$$

## Heat conduction through hollow sphere

Consider a hollow sphere of homogeneous material which heat is flowing only in radial direction

At $r=r_{1} T=T_{1}$ (Initial condition)

At $\mathrm{r}=\mathrm{r}_{2} \mathrm{~T}=\mathrm{T}_{2}$ (Boundary condition)

General heat conduction equation for One dimensional steady state heat conduction with out heat generation

$$
\begin{aligned}
\frac{1}{r 2} \frac{d}{d r}\left(r^{2} \frac{d T}{d r}\right) & =0 \\
\frac{d}{d r}\left(r^{2} \frac{d T}{d r}\right) & =0
\end{aligned}
$$

$$
r^{2} \frac{d T}{d r}=\mathrm{C}_{1}
$$

$$
\frac{d T}{d r}=\frac{\mathrm{C}_{1}}{r^{2}}
$$

$$
\begin{equation*}
\mathrm{T}=-\frac{\mathrm{C}_{1}}{r^{2}}+\mathrm{C}_{2} \tag{A}
\end{equation*}
$$

Appling initial condition

$$
\begin{equation*}
\mathrm{T}_{1}=-\frac{\mathrm{C}_{1}}{r^{2}}+\mathrm{C}_{2} \tag{i}
\end{equation*}
$$

Appling Boundary condition

$$
\begin{equation*}
\mathrm{T}_{2}=-\frac{\mathrm{C}_{1}}{r_{2}}+\mathrm{C}_{2} \tag{ii}
\end{equation*}
$$

By subtracting equations

$$
\begin{aligned}
\mathrm{T}_{1}-\mathrm{T}_{2} & =-\frac{\mathrm{C}_{1}}{r^{2}}+\frac{\mathrm{C}_{1}}{r_{2}} \\
\mathrm{C}_{1} & =\frac{\mathrm{T}_{1}-\mathrm{T}_{2}}{\left(\frac{r_{1}-r_{2}}{r_{1} \cdot r_{2}}\right)} \\
\mathrm{C}_{2} & =\mathrm{T}_{1}+\frac{r_{2}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)}{r_{1}-r_{2}}
\end{aligned}
$$

$\mathrm{C}_{1}$, C2Substitute in equation (A)

$$
\mathrm{T}=-\frac{\mathrm{T}_{1}-\mathrm{T}_{2}}{r\left(\frac{r_{1}-r_{2}}{r_{1} \cdot r_{2}}\right)}+\mathrm{T}_{1}+\frac{r_{2}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)}{r_{1}-r_{2}}
$$

According Fourier's Law

$$
\begin{aligned}
& \mathrm{Q}=-\mathrm{KA} \frac{\partial T}{\partial r} \\
& \mathrm{Q}=-\mathrm{KA} \frac{\partial}{\partial r}\left[-\frac{\mathrm{T}_{1}-\mathrm{T}_{2}}{r\left(\frac{r_{1}-r_{2}}{r_{1} \cdot r_{2}}\right)}+\mathrm{T}_{1}+\frac{r_{2}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)}{r_{1}-r_{2}}\right] \\
& \mathrm{Q}=-\mathrm{KA}\left[\frac{\mathrm{~T}_{1}-\mathrm{T}_{2}}{r^{2}\left(\frac{r_{1}-r_{2}}{r_{1} \cdot r_{2}}\right)}\right]
\end{aligned}
$$

$A=$ surface Area of the sphere $=4 \pi r^{2}$

$$
\mathrm{Q} \quad=-\mathrm{K} 4 \pi \mathrm{r}^{2}\left[\frac{\mathrm{~T}_{1}-\mathrm{T}_{2}}{r^{2}\left(\frac{r_{1}-r_{2}}{r_{1} \cdot r_{2}}\right)}\right]
$$

$$
\begin{aligned}
& \mathrm{Q}=4 \pi \mathrm{~K} \frac{\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)}{\left(\frac{r_{2}-r_{1}}{r_{1} \cdot r_{2}}\right)} \\
& \mathrm{Q}=\frac{\left(\mathrm{T}_{1}-\mathrm{T}_{2}\right)}{\left(\frac{r_{2}-r_{1}}{4 \pi K r_{1} \cdot r_{2}}\right)} \\
& \mathrm{Q}=\frac{(\Delta \mathrm{T})_{\text {overall }}}{R}
\end{aligned}
$$

$\mathrm{R}=$ Thermal resistance $=\frac{r_{2}-r_{1}}{4 \pi K r_{1} \cdot r_{2}}$

## Heat conduction through Composite sphere:-

$$
\begin{align*}
& \mathrm{Q}=\frac{\left(\mathrm{T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)}{\frac{1}{h_{h f} 4 \pi r_{1}^{2}}+\left(\frac{r_{2}-r_{1}}{4 \pi K_{A} r_{1} \cdot r_{2}}\right)+\frac{r_{3}-r_{2}}{4 \pi K_{B} r_{2} \cdot r_{3}}+\frac{1}{h_{c f} 4 \pi r_{3}^{2}}} \\
& \mathrm{Q}=\frac{4 \pi\left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)}{\frac{1}{h_{h f} r_{1}{ }^{2}}+\frac{r_{2}-r_{1}}{K_{A} r_{1} \cdot r_{2}}+\frac{r_{3}-r_{2}}{K_{B} r_{2} \cdot r_{3}}+\frac{1}{h_{c f} r_{3}{ }^{2}}} \tag{B}
\end{align*}
$$

Multiply r1 in denominator and numerator

$$
\begin{aligned}
& \mathrm{Q}=\frac{4 \pi r_{1}^{2}\left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)}{\frac{1}{h_{h f}}+\frac{r_{2}-r_{1}}{K_{A}}\left(\frac{r_{1}}{r_{2}}\right)+\frac{\left(r_{3}-r_{2}\right) r_{1}}{K_{B} r_{2} \cdot r_{3}}+\frac{r_{1}^{2}}{h_{c f} r_{3}^{2}}} \\
& \mathrm{Q}=\frac{A_{i}\left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)}{\frac{1}{h_{h f}}+\frac{r_{2}-r_{1}}{K_{A}}\left(\frac{r_{1}}{r_{2}}\right)+\frac{\left(r_{3}-r_{2}\right) r_{1}}{K_{B} r_{2} \cdot r_{3}}+\frac{r_{1}^{2}}{h_{c f} r_{3}^{2}}}
\end{aligned}
$$

$\mathrm{Q} \quad=\mathrm{U}_{\mathrm{i}} A_{i}\left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)$
$U_{i} \quad=$ Overall heat transfer coefficient based on inner side

$$
\mathrm{U}_{\mathrm{i}}=\frac{1}{\frac{1}{h_{h f}}+\frac{r_{2}-r_{1}}{K_{A}}\left(\frac{r_{1}}{r_{2}}\right)+\frac{\left(r_{3}-r_{2}\right) r_{1}}{K_{B} r_{2} \cdot r_{3}}+\frac{r_{1}^{2}}{h_{c f} r_{3}^{2}}}
$$

Multiply $r_{3}$ in denominator and numerator in eqn.(B)

$$
\begin{aligned}
& \mathrm{Q}=\frac{4 \pi r_{3}^{2}\left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)}{\frac{r_{3}^{2}}{h_{h f} r_{1}^{2}}+\frac{\left(r_{2}-r_{1}\right) r_{3}^{2}}{K_{A} r_{1} r_{2}}+\frac{\left(r_{3}-r_{2}\right) r_{3}}{K_{B} r_{2}}+\frac{1}{h_{c f}}} \\
& \mathrm{Q}=\frac{A_{\mathrm{o}}\left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)}{\frac{r_{3}^{2}}{h_{h f} r_{1}^{2}}+\frac{\left(r_{2}-r_{1}\right) r_{3}^{2}}{K_{A} r_{1} r_{2}}+\frac{\left(r_{3}-r_{2}\right) r_{3}}{K_{B} r_{2}}+\frac{1}{h_{c f}}}
\end{aligned}
$$

We know

$$
\mathrm{Q}=\mathrm{U}_{o} A_{o}\left(\mathrm{~T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}\right)
$$

$\mathrm{U}_{\mathrm{o}}=$ Overall heat transfer coefficient based on outer side

$$
\mathrm{U}_{\mathrm{o}}=\frac{1}{\frac{r_{3}^{2}}{h_{h f} r_{1}^{2}}+\frac{\left(r_{2}-r_{1}\right) r_{3}^{2}}{K_{A} r_{1} r_{2}}+\frac{\left(r_{3}-r_{2}\right) r_{3}}{K_{B} r_{2}}+\frac{1}{h_{c f}}}
$$

## Critical thickness of insulation

Insulation

Purpose of insulation is,

1. it prevents the heat flow from the system to the surroundings
2. it prevents the heat flow from the surroundings to the system

The thickness up to which heat flow increase and after which heat flow decrease is termed as critical thickness. Incase of cylinders and spheres is called "critical radius"

Application:

1. Boilers and steam pipes
2. Air-conditioning system
3. Food preserving stores and refrigerators
4. Insulating bricks
5. Preservation of liquid gases etc,

Critical thickness of insulation for cylinder:-
Consider a solid cylinder of radius $r_{1}$ insulated with an insulation of thickness ( $r_{2}-r_{1}$ ) as shown in fig.
L = length of the cylinder
$\mathrm{T}_{1}=$ Surface temperature of the cylinder

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{a}}=\text { Temperature of air } \\
& \mathrm{K}=\text { Thermal conductivity of insulating material }
\end{aligned}
$$

$$
\mathrm{Q}=\frac{2 \pi L\left(T_{1}-T_{a}\right)}{\frac{\ln \frac{r_{2}}{r_{1}}}{K}+\frac{1}{h_{0} r_{2}}}
$$

$Q$ becomes maximum when denominator becomes minimum

$$
\begin{array}{rlr}
\frac{\partial}{\partial r_{2}}\left(\frac{\ln \frac{r_{2}}{r_{1}}}{K}+\frac{1}{h_{0} r_{2}}\right) & =0 \\
\frac{1}{K} \times \frac{r_{1}}{r_{2}} \times \frac{1}{r_{1}}-\frac{1}{h_{0} r_{2}^{2}} & =0 \\
\frac{1}{K} \times \frac{1}{r_{2}}-\frac{1}{h_{0} r_{2}^{2}} & =0 \\
h_{0} r_{2} & =\mathrm{K} \\
r_{2} & =\frac{K}{h_{0}} & r_{2}=r_{c}=\frac{K}{h}
\end{array}
$$

In the physical sense we may arrived at the following conclusions:-

1. For cylindrical bodies with $r_{1}<r_{c}$ the heat transfer by adding insulation till $r_{2}=r_{c}$. When $r_{1}$ is small and $r_{c}$ is large, the thermal conductivity of insulation $K$ is high (poor insulating material) and $h_{0}$ is low

## Application:

Electric cables - Good insulating for current ,Poor insulating for heat
2. For cylindrical bodies with $r_{1}>r_{c}$ the heat transfer by adding insulation till $r_{2}=r_{c}$. When $r_{1}$ is large and $r_{c}$ is small, the thermal conductivity of insulation K is low and $h_{0}$ is high

## Application:

Steam pipes - Good insulating for heat
Critical thickness of insulation for sphere:

$$
\mathrm{Q}=\frac{\left(T_{1}-T_{a}\right)}{\frac{\left(r_{2}-r_{1}\right)}{4 \pi K r_{1} r_{2}}+\frac{1}{4 \pi h_{0} r_{2}^{2}}}
$$

Q becomes maximum when denominator becomes minimum

$$
\begin{array}{ll}
\frac{\partial}{\partial r_{2}}\left(\frac{\left(r_{2}-r_{1}\right)}{4 \pi K r_{1} r_{2}}+\frac{1}{4 \pi h_{0} r_{2}^{2}}\right)=0 \\
\frac{\partial}{\partial r_{2}}\left(\frac{1}{4 \pi K r_{1}}-\frac{1}{4 \pi K r_{2}}+\frac{1}{4 \pi h_{0} r_{2}^{2}}\right)=0
\end{array}
$$

$$
\begin{aligned}
\frac{1}{4 \pi K r_{2}{ }^{2}}-\frac{2}{4 \pi h_{0} r_{2}{ }^{3}} & =0 \\
\frac{1}{4 \pi K r_{2}{ }^{2}} & =\frac{2}{4 \pi h_{0} r_{2}{ }^{3}}
\end{aligned}
$$

$$
\begin{array}{r}
r_{2}=\frac{2 K}{h_{0}} \\
r_{2}=r_{c}=\frac{2 K}{h}
\end{array}
$$

## Problems:-

1. Calculate the critical radius of insulation for asbestos ( $\mathrm{K}=0.172 \mathrm{~W} / \mathrm{mK}$ ) surrounding a pipe and exposed to room air at 300 K with $\mathrm{h}=2.8 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. Calculate the heat loss from a $475 \mathrm{~K}, 60 \mathrm{~mm}$ diameter pipe when covered with the critical radius of insulation and without insulation.

Given:

$$
\begin{aligned}
\mathrm{K} & =0.172 \mathrm{~W} / \mathrm{mK} \\
\mathrm{~h} & =2.8 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
\mathrm{~T}_{1} & =475 \mathrm{~K} \\
\mathrm{~T}_{\mathrm{a}} & =300 \mathrm{~K}
\end{aligned}
$$

Solution:-
$r_{c} \quad=\frac{K}{h}=\frac{0.172}{2.8}=61.42 \mathrm{~mm}$

Q (with insulation) $=\frac{2 \pi L\left(T_{1}-T_{a}\right)}{\frac{\ln \frac{r_{c}}{r_{1}}}{K}+\frac{1}{h_{0} r_{c}}}$

$$
=110.16 \mathrm{~W} / \mathrm{m}
$$

Q (with out insulation) $=$ ho $2 \pi r_{1} L\left(T_{1}-T_{a}\right)$

$$
=92.36 \mathrm{~W} / \mathrm{m}
$$

2. A small electric heating application uses wire of 2 mm diameter with 0.8 mm thick insulation ( $\mathrm{K}=0.12 \mathrm{~W} / \mathrm{mK}$ ) .the heat transfer coefficient of the insulated surface is $35 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. Determine the critical thickness of insulation in this case and the percentage change in the heat transfer rate if the critical thickness is used. Assuming the temperature difference between the surface of the wire and surrounding air remains unchanged.

Given:

$$
\begin{aligned}
& \mathrm{K}=0.12 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{~h}
\end{aligned}=35 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K},
$$

Solution:-

$$
\mathrm{r}_{\mathrm{c}}=\frac{K}{h} \quad=\frac{0.172}{2.8}=61.42 \mathrm{~mm}
$$

## Case-1

$$
\mathrm{Q}_{1}(\text { with critical insulation })=\frac{2 \pi L\left(T_{1}-T_{a}\right)}{\frac{\ln \frac{r_{c}}{r_{1}}}{K}+\frac{1}{h_{0} r_{c}}}
$$

$$
=\quad\left(T_{1}-T_{a}\right)
$$

## Case - II

$$
\begin{aligned}
\mathrm{Q}_{2} \text { (with insulation) } & =\frac{2 \pi L\left(T_{1}-T_{a}\right)}{\frac{\ln \frac{r_{2}}{r_{1}}}{K}+\frac{1}{h_{0} r_{2}}} \\
& =\left(T_{1}-T_{a}\right) \\
\% \text { increase } & =\frac{Q_{1}-Q_{2}}{Q_{1}} \times 100 \\
& =11.6 \%
\end{aligned}
$$

3. A wire of 6.5 mm diameter at a temperature of $60^{\circ} \mathrm{C}$ is to be insulated by a material having
 temperature is $20^{\circ} \mathrm{C}$. for maximum heat loss, what is the minimum thickness of insulation and heat loss per meter length? Also find percentage increase in the heat dissipation too.

Given:

$$
\begin{aligned}
\mathrm{K} & =0.174 \mathrm{~W} / \mathrm{mK} \\
\mathrm{~h} & =8.722 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
\mathrm{~T}_{1} & =60{ }^{\circ} \mathrm{C} \\
\mathrm{~T}_{\mathrm{a}} & =20{ }^{\circ} \mathrm{C} \\
\mathrm{r}_{1} & =3.25 \mathrm{~mm}
\end{aligned}
$$

Solution:-

$$
\mathrm{r}_{\mathrm{c}} \quad=\frac{K}{h}=\frac{0.174}{8.722}=19.95 \mathrm{~mm}
$$

$\begin{aligned} \mathrm{Q} \text { (with insulation) } & =\frac{2 \pi L\left(T_{1}-T_{a}\right)}{\frac{\ln \frac{r_{c}}{r_{1}}}{K}+\frac{1}{h_{0} r_{c}}} \\ & =15.537 \mathrm{~W} / \mathrm{m}\end{aligned}$
$\mathrm{Q}($ with out insulation $)=$ ho $2 \pi r_{1} L\left(T_{1}-T_{a}\right)$

$$
=7.124 \mathrm{~W} / \mathrm{m}
$$

$\%$ increase $=\frac{Q_{1}-Q_{2}}{Q_{1}} \times 100$

$$
\text { = } 118.09 \text { \% }
$$

Heat conduction with internal heat generation:

Following are some of the cases where heat generation and heat conduction are encountered

1. Fuel rod-Nuclear reactor
2. Electrical conductors
3. Chemical and combustion process
4. Drying and settling of concrete

Plane wall with uniform heat generation :-

Heat conducted

$$
\mathrm{Q}_{\mathrm{x}}=- \text { КА } \frac{d T}{d x}
$$

Heat generated in the element:

$$
\mathrm{Q}_{\mathrm{g}}=\mathrm{A} \cdot \mathrm{dx} \cdot \mathrm{qg}_{\mathrm{g}}
$$

$\mathrm{q}_{\mathrm{g}}=$ Heat generated per unit volume per unit time in the element

Heat conducted $x+d x$ distance

$$
\mathrm{Q}_{(x+\mathrm{d} x)} \quad=\mathrm{a}_{\mathrm{x}}+\frac{\partial}{\partial x}(Q x) \mathrm{dx}
$$

$$
Q_{(x+d x)}=Q_{x}+Q_{g}
$$

$$
\mathrm{Q}_{\mathrm{x}}+\frac{\partial}{\partial x}(Q x) \mathrm{dx} \quad=\mathrm{Q}_{\mathrm{x}}+\mathrm{Q}_{\mathrm{g}}
$$

$$
\mathrm{Q}_{\mathrm{g}}=\frac{\partial}{\partial x}(Q x) \mathrm{dx}
$$

$$
\text { A. } \mathrm{dx} . \mathrm{q}_{\mathrm{g}}=\frac{\partial}{\partial x}\left(- \text { K A } \frac{\partial T}{\partial x}\right) \mathrm{dx}
$$

$$
=- \text { КА } \frac{\partial^{2} T}{\partial x^{2}} \mathrm{dx}
$$

$$
\begin{aligned}
& \mathrm{q}_{\mathrm{g}}=-K \frac{\partial^{2} T}{\partial x^{2}} \\
& \frac{\partial^{2} T}{\partial x^{2}}=-\frac{\mathrm{q}_{g}}{K} \\
& \frac{\partial^{2} T}{\partial x^{2}}+\frac{\mathrm{q}_{g}}{K}=0
\end{aligned}
$$

Integrating twice

$$
\begin{aligned}
\frac{\partial T}{\partial x} & =-\frac{\mathrm{q}_{g}}{K} x+\mathrm{C}_{1} \\
\mathrm{~T} & =-\frac{\mathrm{q}_{g}}{2 K} x^{2}+\mathrm{C}_{1} x+\mathrm{C}_{2}
\end{aligned}
$$

Case - 1

Both the surface having the same temperature:

At $x=0$
$\mathrm{T}=\mathrm{T}_{\mathrm{w}}$ (initial condition)

At $x=L$
$\mathrm{T}=\mathrm{T}_{\mathrm{w}}$ (Boundary condition)

Appling initial condition

$$
\mathrm{C}_{2}=\mathrm{T}_{\mathrm{w}}
$$

Appling Boundary condition :

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{w}}=-\frac{\mathrm{q}_{g}}{2 K} L^{2}+\mathrm{C}_{1} L+\mathrm{T}_{\mathrm{w}} \\
& \mathrm{C}_{1}=\frac{\mathrm{q}_{g}}{2 K} L
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{T} & =-\frac{\mathrm{q}_{g}}{2 K} x^{2}+\frac{\mathrm{q}_{g}}{2 K} L \mathrm{x}+\mathrm{T}_{\mathrm{w}} \\
\mathrm{~T} & =\frac{\mathrm{q}_{g}}{2 K}(L-x) x+\mathrm{T}_{\mathrm{w}}
\end{aligned}
$$

The location of the maximum temperature

$$
\begin{aligned}
\frac{\partial T}{\partial x} & =\frac{\mathrm{q}_{g}}{2 K} L-2 \times \frac{\mathrm{q}_{g}}{2 K} \\
\frac{\partial T}{\partial x}= & \frac{\mathrm{q}_{g}}{2 K}(L-2 x) \\
\frac{\partial T}{\partial x}=0 & \\
\frac{\mathrm{q}_{g}}{2 K}(L-2 x) & =0 \\
x & =\frac{\mathrm{L}}{2} \\
\mathrm{~T}_{\max } & =\frac{\mathrm{q}_{g}}{2 K}\left(L-\frac{L}{2}\right) \frac{L}{2}+\mathrm{T}_{\mathrm{w}} \\
\mathrm{~T}_{\max } & =\frac{\mathrm{q}_{g}}{2 K}\left(\frac{L^{2}}{4}\right)+\mathrm{T}_{\mathrm{w}} \\
\mathrm{~T}_{\max } & =\frac{\mathrm{q}_{g}}{8 K} L^{2}+\mathrm{T}_{\mathrm{w}}
\end{aligned}
$$

According to Fourier's Law
$\mathrm{Q}_{\mathrm{x}}=-K A \frac{d}{d x}\left(\frac{\mathrm{q}_{\mathrm{g}}}{2 K}(\mathrm{~L}-\mathrm{x}) \mathrm{x}+\mathrm{T}_{\mathrm{w}}\right)$

$$
=-K A\left(\frac{\mathrm{q}_{\mathrm{g}}}{2 K}(\mathrm{~L}-2 \mathrm{x})\right)
$$

At $x=L$

$$
\mathrm{Q} \quad=\frac{\mathrm{AL}}{2} q_{g}
$$

When both surface are considered

$$
\mathrm{Q}=2 \times \frac{\mathrm{AL}}{2} q_{g}=\mathrm{ALq} \mathrm{~g}_{\mathrm{g}}
$$

## Problems:-

1. the rate of heat generation in a slab of thickness $160 \mathrm{~mm}\left(\mathrm{~K}=180 \mathrm{~W} / \mathrm{mK}\right.$ ) is $1.2 \times 10^{6} \mathrm{~W} / \mathrm{m}$. If the temperature of each of the surface of the solid is $120^{\circ} \mathrm{C}$ determine.
i) The temperature at the mid and quarter planes,
ii) the heat flow rate

Given data :

$$
\begin{aligned}
\mathrm{T}_{\mathrm{w}} & =1200^{\circ} \mathrm{C} \\
\mathrm{q}_{\mathrm{g}} & =1.2 \times 10^{6} \mathrm{~W} / \mathrm{m} \\
\mathrm{~K} & =180 \mathrm{~W} / \mathrm{mK} \\
\mathrm{~L} & =160 \mathrm{~mm}=0.16 \mathrm{~m}
\end{aligned}
$$

To find :-
(i) $T_{(x=L / 2)}$ \& $T_{(x=L / 4)}$
(ii) $\quad Q_{(x=L / 2)} \& Q_{(x=L / 4)}$

Solution :-
(i)

$$
\begin{aligned}
\mathrm{T} & =\frac{\mathrm{q}_{g}}{2 K}(L-x) x+\mathrm{T}_{\mathrm{w}} \\
\mathrm{~T}_{(x=L / 2)} & =\frac{\mathrm{q}_{g}}{2 K}\left(L^{2} / 4\right)+\mathrm{T}_{\mathrm{w}}=141.33 \circ \mathrm{C} \\
\mathrm{~T}_{(\mathrm{x}=L / 4)} & =\frac{\mathrm{q}_{g}}{2 K}\left(3 L^{2} / 16\right)+\mathrm{T}_{\mathrm{w}}=136 \cong \mathrm{C}
\end{aligned}
$$

$$
\text { (ii) } \mathrm{Q}_{(x=L / 2)}=\mathrm{Axq}_{g} \quad=96000 \mathrm{~W} / \mathrm{m}^{2}
$$

$$
\mathrm{Q}_{(x=L / 4)}=A \times \mathrm{q}_{9}=48000 \mathrm{~W} / \mathrm{m}^{2}
$$

## Extended Surface :- (Fins)

The fins enhance the heat transfer rate from a surface by exposing large surface area to convection. The fins are normally thin strips of highly conducting metals such aluminium, copper, brass etc.

Types of fins:-
i) uniform straight fin
ii) Tapered straight fin
iii) Splines
iv) Annular fin
v) Pin fins(spines)

Heat flow through rectangular Fin:-

$$
\begin{aligned}
& T_{0}=\text { Temperature at the base of the fin } \\
& T_{a}=\text { ambient temperature }
\end{aligned}
$$

Heat conducted into the element

$$
\mathrm{Q}_{\mathrm{x}}=-\mathrm{K} \mathrm{~A}_{\mathrm{cs}} \frac{d T}{d x}
$$

Heat conducted at distance ( $x+d x$ )

$$
\mathrm{Q}_{(x+d x)} \quad=\mathrm{a}_{\mathrm{x}}+\frac{d}{d x}(Q x) \cdot d x
$$

Heat convected out of the element between the planes $x$ and ( $x+d x$ )

$$
\begin{aligned}
Q_{\text {conv }} & =h A d T \\
& =h x(\operatorname{Pxdx}) .\left(T-T_{\mathrm{a}}\right)
\end{aligned}
$$

Appling an energy balance on the element

$$
\begin{aligned}
\mathrm{Q}_{\mathrm{x}} & =\mathrm{Q}_{(x+d x)}+\mathrm{Q}_{\text {conv }} \\
\mathrm{Q}_{\mathrm{x}} & =\mathrm{Q}_{\mathrm{x}}+\frac{d}{d x}(Q x) \cdot d x+\mathrm{h}(\mathrm{Pd} \mathrm{x}) \cdot\left(\mathrm{T}-\mathrm{T}_{\mathrm{a}}\right) \\
-\frac{d}{d x}(Q x) \cdot d x & =\mathrm{h}(\mathrm{Pd} \mathrm{x}) \cdot\left(\mathrm{T}-\mathrm{T}_{\mathrm{a}}\right) \\
-\frac{d}{d x}\left(-\mathrm{K} \mathrm{~A} \frac{d \mathrm{~T}}{d x}\right) \cdot d x & =\mathrm{h}(\mathrm{Pd} \mathrm{x}) \cdot\left(\mathrm{T}-\mathrm{T}_{\mathrm{a}}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{K} \mathrm{~A} \frac{d^{2} T}{d x^{2}}=\mathrm{hP} .\left(\mathrm{T}-\mathrm{T}_{\mathrm{a}}\right) \\
& \frac{d^{2} T}{d x^{2}}=\frac{h p}{K A} \cdot\left(\mathrm{~T}-\mathrm{T}_{\mathrm{a}}\right) \\
& \text { (Or) } \\
& \frac{d^{2}\left(T-T_{a}\right)}{d x^{2}}=\frac{h p}{K A} \cdot\left(\mathrm{~T}-\mathrm{T}_{\mathrm{a}}\right) \\
& \frac{d^{2}\left(T-T_{a}\right)}{d x^{2}}-\frac{h p}{K A} \cdot\left(\mathrm{~T}-\mathrm{T}_{\mathrm{a}}\right)=0 \\
& \mathrm{~T}-\mathrm{T}_{\mathrm{a}}=\theta \\
& \frac{d^{2} \theta}{d x^{2}}-\frac{h p}{K A} \cdot(\theta)=0 \\
& \frac{h p}{K A}=\mathrm{m}^{2} \quad \mathrm{~m}=\sqrt{\frac{h p}{K A}} \\
& \theta=\mathrm{C}_{1} \mathrm{e}^{\mathrm{mx}+\mathrm{C}_{2} \mathrm{e}^{-\mathrm{mx}}} \\
& \frac{d^{2} \theta}{d x^{2}}-\mathrm{m}^{2} \cdot(\theta)=0 \\
& \mathrm{~T}-\mathrm{T}_{\mathrm{a}}=\mathrm{C}_{1} \mathrm{e}^{\mathrm{mx}}+\mathrm{C}_{2} \mathrm{e}^{-\mathrm{mx}}
\end{aligned}
$$

The following cases may be considered

## Case - 1 (Long fin)

The fin is infinitely long and the temperature a tend of the fin ,is equal to the ambient.

Case - 2 (Short fin end is insulated)

The fin is short and the end of the fin is insulated.

Case - 3 (short fin end is not insulated)

The fin is short and the end of the fin is not insulated.(loses by convection)

Heat dissipation from an infinitely long fin
$\mathrm{L}=\infty$

At $x=0, T=T_{o} \quad \theta=\theta_{0}$, (Initial condition)

At $\mathrm{X}=\infty \quad, \mathrm{T}=\mathrm{T}_{\mathrm{a}} \quad \theta=0$ (boundary condition)

Applying initial condition

$$
\begin{aligned}
\theta & =C_{1} e^{m x}+C_{2} e^{-m x} \\
\theta_{0} & =C_{1}+C_{2}
\end{aligned}
$$

applying boundary condition

$$
\begin{aligned}
& \theta=C_{1} e^{m x}+C_{2} e^{-m x} \\
& 0=C_{1} e^{m \infty}+C_{2} e^{-m \infty} \\
& C_{1}=0 \\
& C_{2}=\theta_{0} \\
& \theta \quad=C_{1} e^{m x}+C_{2} e^{-m x} \\
& \theta=\theta_{0} e^{-m x} \\
& T-T_{a}=\left(T_{0}-T_{a}\right) e^{-m x} \\
& T \quad=\left(T_{0}-T_{a}\right) e^{-m x}+T_{a}
\end{aligned}
$$

According to Fourier's law

$$
\mathrm{Q}_{\mathrm{fin}}=-\mathrm{KA} \frac{d T}{d x}
$$

$$
\begin{aligned}
& \left.=-\mathrm{KA} \frac{d}{d x}\left\{\left(\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}\right) \mathrm{e}^{-\mathrm{mx}}+\mathrm{T}_{\mathrm{a}}\right)\right\} \\
& =-\mathrm{KA}(-\mathrm{m})\left(\mathrm{T}_{0}-\mathrm{T}_{\mathrm{a}}\right) \mathrm{e}^{-\mathrm{mx}} \\
& =\mathrm{KAm}\left(\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}\right) \mathrm{e}^{-\mathrm{mx}} \\
\mathrm{~m} & =\sqrt{\frac{h p}{K A}}
\end{aligned}
$$

$$
\text { At } x=0
$$

$$
\mathrm{Q}_{\mathrm{fin}}=\mathrm{KA} \sqrt{\frac{h p}{K A}}\left(\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}\right) \mathrm{e}^{-\mathrm{m}(0)}
$$

$$
\mathrm{Q}_{\mathrm{fin}}=\sqrt{h p K A}\left(\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}\right)
$$

Heat dissipation from a fin insulated at the tip :- (Short fin end insulated)

At $x=0, T=T_{0} \quad \theta=\theta_{0}$, (Initial condition)

$$
\text { At } \mathrm{x}=\mathrm{L}, \frac{d T}{d x}=0 \quad \text { (boundary condition) }
$$

$$
\theta=C_{1} e^{m x}+C_{2} e^{-m x}
$$

Appling initial condition

$$
\theta_{0}=C_{1}+C_{2}
$$

Appling boundary condition

$$
\mathrm{T}-\mathrm{T}_{\mathrm{a}}=\mathrm{C}_{1} \mathrm{e}^{\mathrm{mx}}+\mathrm{C}_{2} \mathrm{e}^{-\mathrm{mx}}
$$

Differentiating both side

$$
\begin{aligned}
\frac{d T}{d x} & =\mathrm{mC}_{1} \mathrm{e}^{\mathrm{mx}}-\mathrm{mC}_{2} \mathrm{e}^{-\mathrm{mx}} \\
\mathrm{mC}_{1} \mathrm{e}^{\mathrm{mL}}-\mathrm{mC}_{2} \mathrm{e}^{-\mathrm{mL}} & =0
\end{aligned}
$$

$$
\mathrm{mC}_{1} \mathrm{e}^{\mathrm{mL}}-\mathrm{m}\left(\theta_{0}-\mathrm{C}_{1}\right) \mathrm{e}^{-\mathrm{mL}} \quad=0
$$

$$
C_{1} e^{m L}-\left(\theta_{0}-C_{1}\right) e^{-m L}=0
$$

$$
C_{1}\left(e^{m L}+e^{-m L}\right) \quad=\theta_{0} e^{-m L}
$$

$$
\mathrm{C}_{1}=\left(\frac{e^{-m l}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right) \theta_{0}
$$

$$
C_{2}=\theta_{0}\left(1-\left(\frac{e^{-m l}}{e^{m L}+e^{-m L}}\right)\right)
$$

Substitute $\mathrm{C}_{1}$, C2 Values

$$
\begin{gathered}
\mathrm{T}-\mathrm{T}_{\mathrm{a}}=\left(\frac{e^{-m l}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right) \theta_{0} \mathrm{e}^{\mathrm{mx}}+\left[1-\left(\frac{e^{-m l}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right)\right] \theta_{0} \mathrm{e}^{-\mathrm{mx}} \\
\mathrm{~T}-\mathrm{T}_{\mathrm{a}}=\left(\frac{e^{-m l}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right)\left(\mathrm{T}_{0}-\mathrm{T}_{\mathrm{a}}\right) \mathrm{e}^{\mathrm{mx}}+\left(\mathrm{T}_{0}-\mathrm{T}_{\mathrm{a}}\right)\left(1-\left(\frac{e^{-m l}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right)\right] \mathrm{e}^{-\mathrm{mx}} \\
\left(\frac{\mathrm{~T}-\mathrm{T}_{\mathrm{a}}}{\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}}\right)=\left(\frac{e^{-m l}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right) \mathrm{e}^{\mathrm{mx}}+1-\left(\frac{e^{-m l}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right) \mathrm{e}^{-\mathrm{mx}} \\
\left(\frac{\mathrm{~T}-\mathrm{T}_{\mathrm{a}}}{\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}}\right)=\left(\frac{e^{m(x-l)}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right)+\left(\frac{e^{m(l-x)}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right)
\end{gathered}
$$

$$
\begin{aligned}
& \left(\frac{\mathrm{T}-\mathrm{T}_{\mathrm{a}}}{\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}}\right)=\left(\frac{e^{m(x-l)}+e^{m(l-x)}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right) \\
& \left(\frac{\mathrm{T}-\mathrm{T}_{\mathrm{a}}}{\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}}\right)=\left(\frac{e^{m(l-x)}+e^{-m(l-x)}}{\mathrm{e}^{\mathrm{mL}}+\mathrm{e}^{-\mathrm{mL}}}\right) \\
& \left(\frac{\mathrm{T}-\mathrm{T}_{\mathrm{a}}}{\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}}\right)=\left(\frac{\cosh m(l-x)}{\operatorname{coshml}}\right)
\end{aligned}
$$

According to Fourier's law

$$
\text { At } x=0
$$

$$
\mathrm{Q}_{\mathrm{fin}}=\sqrt{h p K A}\left(\frac{\sinh m l}{\operatorname{coshml}}\right)\left(\mathrm{T}_{\mathrm{o}}-\mathrm{T}_{\mathrm{a}}\right)
$$

$$
\mathrm{Q}_{\mathrm{fin}} \quad=\sqrt{h p K A}\left(\mathrm{~T}_{\mathrm{o}}-\mathrm{T}_{\mathrm{a}}\right) \tanh m l
$$

$$
\begin{aligned}
& \mathrm{Q}_{\text {fin }}=-\mathrm{KA} \frac{d T}{d x} \\
& =-K \mathrm{~A} \frac{d}{d x}\left[\left(\frac{\cosh m(l-x)}{\operatorname{coshml}}\right)\left(\mathrm{T}_{0}-T_{\mathrm{a}}\right)+\mathrm{T}_{\mathrm{a}}\right] \\
& =K A m\left(\frac{\sinh m(l-x)}{\operatorname{coshml}}\right)\left(T_{0}-T_{a}\right) \\
& \mathrm{Q}_{\text {fin }} \quad=\mathrm{KA} \sqrt{\frac{h p}{K A}}\left(\frac{\sinh m(l-x)}{\operatorname{coshml}}\right)\left(\mathrm{T}_{0}-\mathrm{T}_{\mathrm{a}}\right) \\
& \mathrm{Q}_{\text {fin }}=\sqrt{h p K A}\left(\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}\right)\left(\frac{\sinh m(l-x)}{\operatorname{coshml}}\right)
\end{aligned}
$$

Heat dissipation from a fin losing heat at the tip (short fin end is not insulated)

Temperature distribution

$$
\left(\frac{\mathrm{T}-\mathrm{T}_{\mathrm{a}}}{\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}}\right)=\frac{\cosh m(l-x)+h / k m \sinh m(l-x)}{\cosh m l+h / k m \sinh m l}
$$

$$
\mathrm{Q}_{\mathrm{fin}}=\sqrt{h p K A}\left(\mathrm{~T}_{0}-\mathrm{T}_{\mathrm{a}}\right)\left(\frac{\tanh m l+h / k m}{1+\mathrm{k} / \mathrm{km} \tanh m l}\right)
$$

4.4.1. Fin Effectiveness, $\sum \mathbf{f}$ : Fins are used to increase the heat transfer from a surface by increasing the effective surface area. When fins are not present, the heat convected by the base area is given by $\operatorname{Ah}(T o-$ $T \infty)$, where $A$ is the base area. When fins are used the heat transferred by the fins, $q f$, is calculated using equations. The ratio of these quantities is defined as fin effectiveness.

$$
\varepsilon_{f}=\frac{q_{f}}{h A\left(T_{b}-T_{\infty}\right)}
$$

Fin efficiency, $\eta \mathbf{\eta}$ : This quantity is more often used to determine the heat flow when variable area fins are used. Fin efficiency is defined as the ratio of heat transfer by the fin to the heat transfer that will take place if the whole surface area of the fin is at the base temperature.

$$
\eta_{f}=\frac{q_{f}}{h A_{s}\left(T_{b}-T_{\infty}\right)}
$$

## CIRCUMFERENTIAL FINS AND PLATE FINS OF VARYING SECTIONS

Circumferential fins and plate fins of varying sections are in common use. The preceding analysis has not taken this into account. As already mentioned the fin efficiency is correlated to the combination of parameters $L, t, h$ and $k$ (length, thickness, convection coefficient and thermal conductivity). Once these are specified, the chart can be entered by using the parameter to determine efficiency. The value of efficiency, the surface area, temperature and convection coefficient provide the means to calculate the heat dissipated.

$$
Q=\text { fin efficiency. } A s h(T b-T \infty)
$$

Charts are available for constant thickness circumferential fins, triangular section plate fins and pin fins of different types. The parameters used for these charts are given in the charts.

The fin efficiency chart for circumferential fins is given below:

Heat transfer equipments operating at steady state is only one phase of their functioning. These have to be started and shut down as well as their performance level may have to be altered as per external requirements. A heat exchanger will have to operate at different capacities. This changes the conditions at the boundary of heat transfer surfaces. Before a barrier begins to conduct heat at steady state the barrier has to be heated or cooled to the temperature levels that will exist at steady conditions. Thus the study of transient conduction situation is an important component of conduction studies. This study is a little more complicated due to the introduction of another variable namely time to the parameters affecting conduction. This means that temperature is not only a function of location but also a function of time, $\tau$, i.e. $\mathrm{T}=\mathrm{T}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \tau)$. In addition heat capacity and heat storage (as internal energy) become important parameters of the problem. The rate of temperature change at a location and the spatial temperature distribution at any time are the important parameters to be determined in this study. This automatically provides information about the heat conduction rate at any time or position through the application of Fourier law.

## LUMPED PARAMETER MODEL

It is also known as lumped heat capacity system. This model is applicable when a body with a known or specified temperature level is exposed suddenly to surroundings at a different temperature level and when the temperature level in the body as a whole increases or decreases without any difference of temperature
within the body. i.e., $T=T(\tau)$ only. Heat is received from or given to the surroundings at the surface and this causes a temperature change
instantly all through the body. The model is shown in Fig.

The body with surface area $A s$, volume $V$, density $\rho$, specific heat $c$ and temperature $T$ at the time instant zero is exposed suddenly to the surroundings at $T \infty$ with a convection coefficient $h$ (may be radiation coefficient $h r$ ). This causes the body temperature $T$ to change to $T+d T$ in the time interval $d \tau$. The relationship between $d T$ and $d \tau$ can be established by the application of the energy conservation principle. Heat convected over the boundary $=$ Change in internal energyover a time period $d \tau$ during this time
If $d T$ is the temperature change during the time period $d \tau$ then the following relationship results: ( $A s$-Surface area)

$$
h A s(T-T \infty) d \tau=\rho c V d T
$$

This equation can be integrated to obtain the value of $T$ at any time. The integration is possible after introducing a new variable.
$\theta=\mathrm{T}-\mathrm{T} \infty$
The equation now becomes
$\mathrm{hA}_{\mathrm{s}} \theta \mathrm{d} \tau=\rho \mathrm{cVd} \theta$

$$
\frac{h A_{s}}{\rho c V} d \tau=d \theta
$$

Separating the variables and integrating and using the initial conditions that at $\tau=0, \theta=\theta_{o}$ and denoting $\mathrm{V} / \mathrm{A}_{\mathrm{s}}=\mathrm{L}$, we get

$$
\ln \frac{\theta}{\theta_{o}}=\frac{h A_{s}}{\rho c V} \tau
$$

Substituting for $\theta$ and $\theta_{o}$ and taking the antilog

$$
\frac{T-T_{\infty}}{T_{o}-T_{\infty}}=e^{-\frac{h A_{s}}{\rho c V} \tau}=e^{-\frac{h}{\rho c L} \tau}
$$

Heat flow up to time $\tau$

$$
\theta=\rho c \mathrm{~V}\left(\mathrm{~T}_{\tau}-\mathrm{T}_{\mathrm{i}}\right)
$$

## SEMI INFINITE SOLID

Theoretically a solid which extends in both the positive and negative $y$ and $z$ directions to infinity and in the positive $x$ direction to infinity is defined as a semi infinite body. There can be no such body in reality. If one surface of a solid with a particular temperature distribution is suddenly exposed to convection conditions or has its surface temperature changed suddenly, conduction will produce a change in the temperature distribution along the thickness of the body. If this change does not reach the other side or surface of the solid under the time under consideration, then the solid may be modeled as semi infinite solid. A thick slab with a low value of thermal diffusivity exposed to a different environment on its surface can be treated as semi infinite body, provided heat does not penetrate to the full depth in the time
under consideration. A road surface exposed to solar heat or chill winds can be cited as an example of a semi infinite body. There are a number of practical applications in engineering for the semi infinite medium conduction.
The differential equation applicable is the simplified general heat conduction equation: in rectangular coordinates, (excluding heat generation) eqn.

$$
\frac{\partial^{2} T}{\partial x^{2}}=\frac{1}{\alpha} \frac{\partial T}{\partial \tau}
$$

There are three types of boundary conditions for which solutions are available in a simple form. These are (i) at time $\tau=0$, the surface temperature is changed and maintained at a specified value, (ii) at time $\tau=0$, the surface exposed to convection at $T \infty$ and (iii) at time $\tau=0$, the surface is exposed to a constant heat flux $q$.

$$
\text { at } \tau=0, T(x, \tau)=T i \text {, or } T(x, 0)=\mathrm{T} i
$$

For $\tau>0, T(0, \tau)=T s$ i.e. at $x=0, T=T s$ at all times.
The analytical solution for this case is given by derivation available in specialized texts on conduction

$$
\frac{T_{x, \tau}-T_{s}}{T_{i}-T_{s}}=\operatorname{erf}\left(\frac{x}{2 \sqrt{\alpha \tau}}\right)
$$

where, erf indicates "error function of" and the definition of error function is generally available in mathematical texts. Usually tabulations of error function values are available in handbooks. (Refer appendix).
The heat flow at the surface at any time is obtained using Fourier's equation $-k \mathrm{~A}(d \mathrm{~T} / d x)$. The surface heat flux at time $\tau$ is

$$
q_{s}(\tau)=k\left(T_{s}-T_{i}\right) / \sqrt{\pi \alpha \tau}
$$

The total heat flow during a given period can be obtained by integrating $q s(\tau) d \tau$ between the limits of 0 and $\tau$

$$
\mathrm{Q}_{\tau}=2 k \times A\left(T_{s}-T_{i}\right) \sqrt{\tau / \pi \alpha}
$$

## TRANSIENT HEAT CONDUCTION IN LARGE SLAB OF LIMITED THICKNESS, LONG CYLINDERS AND SPHERES

This model is the one which has a large number of applications in heating and cooling processes a special case being heat treatment. The general solution process attempts to estimate the temperature at a specified location in a body (which was at a specified initial temperature) after exposure to a different temperature surroundings for a specified time. The other quantity of interest is the change in the internal energy of the body after such exposure.

The differential equation applicable for a slab extending to $\infty$ in the $y$ and $z$ directions and thickness $2 L$ in the $x$ direction with both surfaces suddenly exposed to the surroundings is equation

$$
\frac{\partial^{2} T}{\partial x^{2}}=\frac{1}{\alpha} \frac{\partial T}{\partial \tau}
$$

The initial condition at time zero is
$T=T i$ all through the solid. i.e. $x=-L$ to $x=L$.
The boundary condition is

$$
h\left(T_{\infty}-T_{\mathrm{L}}\right)=-k \frac{\partial T}{\partial x} \text { at } x=L \text { and } x=-L
$$

at $x=L$ and $x=-L$
The equation is solved using a set of new variables $X$ and $\theta$ defining $T=X . \theta$ ( $X$ is a function of $x$ only and $\theta$ is a function of $\tau$ only). The algebra is long and tedious.
The solution obtained is given below :

$$
\frac{T_{x, \tau}-T_{\infty}}{T_{i}-T_{\infty}}=\sum_{n=1}^{\infty} \frac{2 \operatorname{Bi} \sin \left(\delta_{n}\right) \cos \left(\delta_{n} x / L\right)}{\delta_{n}\left(\mathrm{Bi}+\sin ^{2} \delta_{n}\right)} \cdot e^{-\delta_{n}{ }^{2} \cdot \mathrm{Fo}}
$$

The temperature essentially is a function of $B i, F o$ and $x / L$ or $T=f(B i, F o, x / L)$

$$
\begin{array}{ll}
\text { Where } & T_{x, \tau}=\text { the temperature at } x \text { and } \tau \\
& T_{i}=\text { initial temperature } \\
T_{\infty}=\text { surrounding temperature } \\
& B i=h L / k=\text { Biot number } \\
& \text { Fo }=\text { Fourier number }=\alpha \tau / L^{2} \\
& \delta_{n}=\text { roots of the equation } \delta_{n} \text { tan } \delta_{n}=B i
\end{array}
$$

The solution using calculating devices is rather tedius and the results in a graphical form, was first published by Heisler in 1947, using the parameters Biot number and Fourier number

Heat Transfer during a given time period: The total heat transfer can be obtained by using

$$
Q=\int_{0}^{\tau} h\left(T_{\mathrm{L}, \tau}-T_{\infty}\right) d \tau
$$

and substituting for $T L, \tau$ from equation (6.21). As the resulting expression indicates that it is a function of $h^{2} \alpha \tau / k^{2}$ and $h L / k$ these solutions have been presented by Heisler as shown in the skeleton form in Fig as $Q / Q o$. where $Q$-heat transferred over the given period, and

## Heat and mass Transfer

## Unit I

## November 2008

1. Calculate the rate of heat loss through the vertical walls of a boiler furnace of size 4 m by 3 m by 3 m high. The walls are constructed from an inner fire brick wall 25 cm thick of thermal conductivity $0.4 \mathrm{~W} / \mathrm{mK}$, a layer of ceramic blanket insulation of thermal conductivity $0.2 \mathrm{~W} / \mathrm{mK}$ and 8 cm thick, and a steel protective layer of thermal conductivity $55 \mathrm{~W} / \mathrm{mK}$ and 2 mm thick. The inside temperature of the fire brick layer was measured at $600^{\circ} \mathrm{C}$ and the temperature of the outside of the insulation $60^{\circ} \mathrm{C}$. Also find the interface temperature of layers.

## Given:

Composite Wall
$\mathrm{l}=\mathbf{4 m} \quad \mathrm{b}=\mathbf{3 m} \quad \mathrm{h}=\mathbf{3 m}$
Area of rectangular wall $\mathrm{lb}=4 \times 3=12 \mathrm{~m}^{2}$
$\mathrm{L}_{1}=25 \mathrm{~cm}$
$\mathrm{k}_{1}=\mathbf{0} .4 \mathrm{~W} / \mathbf{m K}$

Fire brick
$\left.\begin{array}{l}\mathrm{L}_{2}=0.002 \mathrm{~m} \\ \mathrm{k}_{2}=\mathbf{5 4} \mathbf{~ W} / \mathbf{m K}\end{array}\right\}$ Steel
$\left.\begin{array}{l}\mathrm{L}_{3}=0.08 \mathrm{~m} \\ \mathrm{k}_{1}=\mathbf{0 . 2} \mathbf{W} / \mathrm{mK}\end{array}\right\}$ insulation
$\mathrm{T}_{1}=600^{\circ} \mathrm{C}$
$\mathrm{T}_{2}=60^{\circ} \mathrm{C}$
Find
(i) Q
(ii) $\left(\mathrm{T}_{3}-\mathrm{T}_{4}\right)$

Solution
We know that,

$$
Q=\frac{(\Delta T)_{\text {overall }}}{\Sigma R_{\text {th }}}
$$

Here
( $\Delta \mathrm{T}$ ) overall $=\mathrm{T}_{1-} \mathrm{T}_{4}$
And $\quad \Sigma \mathrm{R}_{\mathrm{th}}=\mathrm{R}_{\mathrm{th} 1}+\mathrm{R}_{\mathrm{th} 2}+\mathrm{R}_{\mathrm{th} 3}$

$$
\begin{aligned}
& \mathrm{R}_{\mathrm{th} 1}=\frac{L_{1}}{k_{1} A}=\frac{0.25}{0.4 \times 12}=0.0521 \mathrm{~K} / \mathrm{W} \\
& \mathrm{R}_{\mathrm{th} 2}=\frac{L_{2}}{k_{2} A}=\frac{0.08}{0.2 \times 12}=0.0333 \mathrm{~K} / \mathrm{W} \\
& \mathrm{R}_{\mathrm{th} 3}=\frac{L_{3}}{k_{3} A}=\frac{0.002}{54 \times 12}=0.0000031 \mathrm{~K} / \mathrm{W}
\end{aligned}
$$

$$
\begin{aligned}
& Q=\frac{T_{1}-T_{4}}{R_{t h 1}+R_{t h 2}+R_{t h 3}} \\
& =\frac{600-60}{0.0521+0.0000031+0.0333} \\
& Q=6320.96 \mathrm{~W}
\end{aligned}
$$

(i) To find temperature drop across the steel layer $\left(\mathrm{T}_{2}-\mathrm{T}_{3}\right)$

$$
Q=\frac{T_{2}-T_{3}}{R_{t h 3}}
$$

$$
\begin{aligned}
\mathrm{T}_{3}-\mathrm{T}_{4} & =\mathrm{Q} \times \mathrm{R}_{\mathrm{th} 2} \\
& =6320.96 \times 0.0000031 \\
\mathrm{~T}_{3}-\mathrm{T}_{4} & =0.0196 \mathrm{~K} .
\end{aligned}
$$

2. A spherical container of negligible thickness holding a hot fluid at $140^{\circ}$ and having an outer diameter of 0.4 m is insulated with three layers of each 50 mm thick insulation of $k_{1}=0.02: k_{2}=0.06$ and $k_{3}=0.16 \mathrm{~W} / \mathrm{mK}$. (Starting from inside). The outside surface temperature is $30^{\mathbf{0}} \mathrm{C}$. Determine (i) the heat loss, and (ii) Interface temperatures of insulating layers.

Given:

$$
\begin{aligned}
\mathrm{OD} & =0.4 \mathrm{~m} \\
\mathrm{r}_{1} & =0.2 \mathrm{~m} \\
\mathrm{r}_{2} & =\mathrm{r}_{1}+\text { thickness of } 1^{\text {st }} \text { insulation } \\
& =0.2+0.05 \\
\mathrm{r}_{2} & =0.25 \mathrm{~m} \\
\mathrm{r}_{3} & =\mathrm{r}_{2}+\text { thickness of } 2^{\text {nd }} \text { insulation } \\
& =0.25+0.05 \\
\mathrm{r}_{3} & =0.3 \mathrm{~m} \\
\mathrm{r}_{4} & =\mathrm{r}_{3}+\text { thickness of } 3^{\text {rd }} \text { insulation } \\
& =0.3+0.05 \\
\mathrm{r}_{4} & =0.35 \mathrm{~m} \\
\mathrm{~T}_{\mathrm{hf}} & =140^{\circ} \mathrm{C}, \mathrm{~T}_{\mathrm{cf}}=30^{\circ} \mathrm{C}, \\
\mathrm{k}_{1} & =0.02 \mathrm{~W} / \mathrm{mK} \\
\mathrm{k}_{2} & =0.06 \mathrm{~W} / \mathrm{mK} \\
\mathrm{k}_{3} & =0.16 \mathrm{~W} / \mathrm{mK} .
\end{aligned}
$$

Find (i) Q (ii) $\mathrm{T}_{2}, \mathrm{~T}_{3}$

## Solution

$$
\begin{gathered}
Q=\frac{(\Delta T)_{\text {overall }}}{\sum R_{\text {th }}} \\
\Delta \mathrm{T}=\mathrm{T}_{\mathrm{hf}-} \mathrm{T}_{\mathrm{cf}} \\
\Sigma \mathrm{R}_{\mathrm{th}}=\mathrm{R}_{\mathrm{th} 1}+\mathrm{R}_{\mathrm{th} 2}+\mathrm{R}_{\mathrm{th} 3} \\
\mathrm{R}_{\mathrm{th} 1}=\frac{r_{2-} r_{1}}{4 \pi k_{1} r_{2} r_{1}}=\frac{(0.25-0.20)}{4 \pi \times 0.02 \times 0.25 \times 0.2}=3.978^{\circ} \mathrm{C} / \mathrm{W} \\
\mathrm{R}_{\mathrm{th} 2}=\frac{r_{3} r_{2}}{4 \pi k_{2} r_{3} r_{2}}=\frac{(0.30-0.25)}{4 \pi \times 0.0600 .3 \times 0.25}=0.8842^{\circ} \mathrm{C} / \mathrm{W} \\
\mathrm{R}_{\mathrm{th} 1}=\frac{r_{4-} r_{3}}{4 \pi k_{3} r_{4} r_{3}}=\frac{(0.35-0.30)}{4 \pi \times 0.16 \times 0.35 \times 0.30}=0.23684^{\circ} \mathrm{C} / \mathrm{W} \\
Q=\frac{140-30}{0.0796+0.8842+0.23684} \\
\mathrm{Q}=21.57 \mathrm{~W}
\end{gathered}
$$

To find interface temperature $\left(\mathrm{T}_{2}, \mathrm{~T}_{3}\right)$

$$
\begin{gathered}
Q=\frac{T_{2}-T_{3}}{R_{t h 1}} \\
\mathrm{~T}_{2}=\mathrm{T}_{1}-\left[\mathrm{Q} \times R_{t h 1}\right] \\
=140-[91.62 \times 0.0796] \\
\mathrm{T}_{2}=54.17^{0} \mathrm{C} \\
Q=\frac{T_{2}-T_{3}}{R_{t h 1}} \\
\mathrm{~T}_{3}=\mathrm{T}_{2}-\left[\mathrm{Q} \times R_{t h 2}\right] \\
=132.71-[91.62 \times 0.8842] \\
\mathrm{T}_{3}=35.09^{\circ} \mathrm{C}
\end{gathered}
$$

## 3. May 2008

A steel tube with 5 cm ID, 7.6 cm OD and $\mathrm{k}=15 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ is covered with an insulative covering of thickness 2 cm and $\mathrm{k} 0.2 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C} \cdot \mathrm{A}$ hot gas at $330^{\circ} \mathrm{C}$ with $\mathrm{h}=400 \mathrm{~W} / \mathrm{m}^{20} \mathrm{C}$ flows inside the tube. The outer surface of the insulation is exposed to cooler air at $30^{\circ} \mathrm{C}$ with $h=60 \mathrm{~W} / \mathrm{m}^{20} \mathrm{C}$. Calculate the heat loss from the tube to the air for $\mathbf{1 0} \mathrm{m}$ of the tube and the temperature drops resulting from the thermal resistances of the hot gas flow, the steel tube, the insulation layer and the outside air.

## Given:

Inner diameter of steel, $\mathrm{d}_{1}=5 \mathrm{~cm}=0.05 \mathrm{~m}$
Inner radius, $\mathrm{r}_{1}=0.025 \mathrm{~m}$
Outer diameter of steel, $\mathrm{d}_{2}=7.6 \mathrm{~cm}=0.076 \mathrm{~m}$
Outer radius, $\mathrm{r}_{2}=0.025 \mathrm{~m}$
Radius, $\mathrm{r}_{3}=\mathrm{r}_{2}+$ thickness of insulation

$$
=0.038+0.02 \mathrm{~m}
$$

$$
\mathrm{r}_{3}=0.058 \mathrm{~m}
$$

Thermal conductivity of steel, $\mathrm{k}_{1}=15 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$
Thermal conductivity of insulation, $\mathrm{k}_{2}=0.2 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$
Hot gas temperature, $\mathrm{T}_{\mathrm{hf}}=330^{\circ} \mathrm{C}+273=603 \mathrm{~K}$
Heat transfer co-efficient at innear side, $\mathrm{h}_{\mathrm{hf}}=400 \mathrm{~W} / \mathrm{m}^{2{ }^{\circ}} \mathrm{C}$
Ambient air temperature, $\mathrm{T}_{\mathrm{cf}}=30^{\circ} \mathrm{C}+273=303 \mathrm{~K}$
Heat transfer co-efficient at outer side $\mathrm{h}_{\mathrm{cf}}=60 \mathrm{~W} / \mathrm{m}^{20} \mathrm{C}$.
Length, $\mathrm{L}=10 \mathrm{~m}$

## To find:

(i) Heat loss (Q)
(ii) Temperature drops $\left(\mathrm{T}_{\mathrm{hf}}-\mathrm{T}_{1}\right),\left(\mathrm{T}_{1}-\mathrm{T}_{2}\right),\left(\mathrm{T}_{2}-\mathrm{T}_{3}\right),\left(\mathrm{T}_{3}-\mathrm{T}_{\mathrm{cf}}\right)$,

## Solution:

Heat flow $Q=\frac{\Delta T_{\text {overall }}}{\sum R_{\text {th }}}$
Where

$$
\begin{gathered}
\Delta \mathrm{T}_{\text {overall }}=\mathrm{T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}} \\
R=\frac{1}{2 \pi L}\left[\frac{1}{h_{h f} r_{1}}+\frac{1}{k_{1}} \ln \left[\frac{r_{2}}{r_{1}}\right]+\frac{1}{k_{2}} \ln \left[\frac{r_{3}}{r_{2}}\right]+\frac{1}{k_{3}} \ln \left[\frac{r_{4}}{r_{3}}\right]+\frac{1}{h_{c f} r_{4}}\right] \\
Q=\frac{T_{h f}-T_{c f}}{\frac{1}{2 \pi L}\left[\frac{1}{h_{h f} r_{1}}+\frac{1}{k_{1}} \ln \left[\frac{r_{2}}{r_{1}}\right]+\frac{1}{k_{2}} \ln \left[\frac{r_{3}}{r_{2}}\right]+\frac{1}{h_{c f} r_{3}}\right]} \\
603-303
\end{gathered} \begin{aligned}
& \frac{1}{2 \pi \times 10}\left[\frac{1}{400 \times 0.025}+\frac{1}{15} \ln \left[\frac{0.038}{0.025}\right]+\frac{1}{0.2} \ln \left[\frac{0.058}{0.038}\right]+\frac{1}{60 \times 0.058}\right] \\
& \mathrm{Q}=7451.72 \mathrm{~W}
\end{aligned}
$$

We know that,

$$
\begin{aligned}
& Q=\frac{T_{h f}-T_{1}}{R_{t h} \text { conv. }} \\
& =\frac{\frac{T_{h f}-T_{1}}{\frac{1}{2 \pi L} \times \frac{1}{h_{h f} r_{1}}}}{7451.72=\frac{T_{h f}-T_{1}}{2 \times \pi \times 10} \times \frac{1}{400 \times 0.025}} \\
& T_{h f}-T_{1}=11.859 K \\
& Q=\frac{T_{1}-T_{2}}{R_{t h 1}} \\
& =\frac{T_{1}-T_{2}}{\frac{1}{2 \pi L} \times\left[\frac{1}{k_{1}} \ln \left[\frac{r_{2}}{r_{1}}\right]\right]}
\end{aligned}
$$

$$
\begin{aligned}
& 7451.72=\frac{T_{1}-T_{2}}{\frac{1}{2 \times \pi \times 10} \times \frac{1}{15} \ln \left[\frac{0.038}{0.025}\right]} \\
& T_{1}-T_{2}=3.310 \mathrm{~K} \\
& Q=\frac{T_{2}-T_{3}}{R_{t h 2}} \\
& =\frac{T_{2}-T_{3}}{\frac{1}{2 \pi L} \times\left[\frac{1}{k_{2}} \ln \left[\frac{r_{3}}{r_{2}}\right]\right]} \\
& 7451.72=\frac{T_{2}-T_{3}}{\frac{1}{2 \times \pi \times 10} \times \frac{1}{0.2} \ln \left[\frac{0.058}{0.038}\right]} \\
& T_{2}-T_{3}=250.75 \mathrm{~K} \\
& Q=\frac{T_{3}-T_{c f}}{R_{t h} \text { conv } .} \\
& =\frac{\frac{T_{3}-T_{c f}}{1}}{\frac{1}{2 \pi L} \times \frac{1}{h_{c f} r_{3}}} \\
& 7451.72=\frac{T_{3}-T_{c f}}{\frac{1}{2 \times \pi \times 10} \times\left[\frac{1}{60 \times 0.058}\right]} \\
& T_{3}-T_{c f}=34.07 \mathrm{~K}
\end{aligned}
$$

Nov 2009
4. A long pipe of 0.6 m outside diameter is buried in earth with axis at a depth of 1.8 m . the surface temperature of pipe and earth are $95^{\circ} \mathrm{C}$ and $25^{\circ} \mathrm{C}$ respectively. Calculate the heat loss from the pipe per unit length. The conductivity of earth is $0.51 \mathrm{~W} / \mathrm{mK}$.

Given

Find
Heat loss from the pipe (Q/L)

## Solution

We know that

$$
\frac{Q}{L}=k \cdot S\left(T_{p}-T_{e}\right)
$$

Where $\mathrm{S}=$ Conduction shape factor $=$

$$
\begin{aligned}
& \frac{2 \pi L}{\ln \left(\frac{2 D}{r}\right)} \\
= & \frac{2 \pi \times 1}{\ln \left(\frac{2 \times 1.8}{0.3}\right)}
\end{aligned}
$$

$$
\mathrm{S}=2.528 \mathrm{~m}
$$

$$
\begin{gathered}
\frac{Q}{L}=0.51 \times 2.528(95-25) \\
\frac{Q}{L}=90.25 \mathrm{~W} / \mathrm{m}
\end{gathered}
$$

Nov. 2010
5. A steam pipe of 10 cm ID and $11 \mathrm{~cm} O D$ is covered with an insulating substance $k=1$ $\mathrm{W} / \mathrm{mK}$. The steam temperature is $200^{\circ} \mathrm{C}$ and ambient temperature is $20^{\circ} \mathrm{C}$. If the convective heat transfer coefficient between insulating surface and air is $8 \mathbf{W} / \mathbf{m}^{2} \mathrm{~K}$, find the critical radius of insulation for this value of $r_{c}$. Calculate the heat loss per $m$ of pipe and the outer surface temperature. Neglect the resistance of the pipe material.

Given:

$$
\begin{array}{r}
r_{i}=\frac{I D}{2}=\frac{10}{2}=5 \mathrm{~cm}=0.05 \mathrm{~m} \\
r_{0}=\frac{O D}{2}=\frac{11}{2}=5.5 \mathrm{~cm}=0.055 \mathrm{~m}
\end{array}
$$

$$
\mathrm{k}=1 \mathrm{~W} / \mathrm{mK}
$$

$$
\mathrm{T}_{\mathrm{i}}=200^{\circ} \mathrm{C} \quad \mathrm{~T}_{\infty}=20^{\circ} \mathrm{C}
$$

$$
\mathrm{h}_{0}=8 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
$$

Find
(i) $r_{c}$
(ii) If $r_{c}=r_{o}$ then $Q / L$
(iii) $\mathrm{T}_{\mathrm{o}}$

## Solution

To find critical radius of insulation ( $\mathrm{r}_{\mathrm{c}}$ )

$$
r_{0}=\frac{k}{h_{0}}=\frac{1}{8}=0.125 \mathrm{~m}
$$

When $r_{c}=r_{o}$
Kpipe, $\mathrm{h}_{\mathrm{hf}}$ not given

$$
\frac{Q}{L}=\frac{2 \pi\left(T_{0}-T_{\infty}\right)}{\frac{\ln \left(\frac{r_{c}}{r_{o}}\right)}{k}+\frac{1}{h_{o} r_{o}}}
$$

$$
\begin{array}{r}
=\frac{2 \pi(200-20)}{\frac{\ln \left(\frac{0.125}{0.050}\right)}{1}+\frac{1}{8 \times 0.125}} \\
\frac{Q}{L}=621 \mathrm{~W} / \mathrm{m}
\end{array}
$$

To Find $\mathrm{T}_{\mathrm{o}}$

$$
\begin{aligned}
& \frac{Q}{L}=\frac{T_{0}-T_{\infty}}{R_{\text {thconv }}} \\
& T_{0}=T_{\infty}+\frac{Q}{L}\left(R_{\text {thconv }}\right) \\
& =20+621 \times\left(\frac{1}{8 \times 2 \pi \times 0.125}\right) \\
& \mathrm{T}_{0}=118.72^{\circ} \mathrm{C}
\end{aligned}
$$

November 2011.
6. The temperature at the inner and outer surfaces of a boiler wall made of 20 mm thick steel and covered with an insulating material of $5 \mathbf{m m}$ thickness are $300^{\circ} \mathrm{C}$ and $50^{\mathbf{0}}$ $C$ respectively. If the thermal conductivities of steel and insulating material are $58 \mathrm{~W} / \mathrm{m}^{0} \mathrm{C}$ and $0.116 \mathrm{~W} / \mathrm{m}^{0} \mathrm{C}$ respectively, determine the rate of flow through the boiler wall.

$$
\begin{aligned}
& \mathrm{L} 1=20 \times 10^{-3} \mathrm{~m} \\
& \mathrm{k}_{1}=58 \mathrm{~W} / \mathrm{m}^{0} \mathrm{C} \\
& \mathrm{~L}_{2}=5 \times 10^{-3} \mathrm{~m} \\
& \mathrm{k}_{2}=0.116 \mathrm{~W} / \mathrm{m}^{0} \mathrm{C} \\
& \mathrm{~T}_{1}=300^{0} \mathrm{C} \\
& \mathrm{~T}_{2}=50^{0} \mathrm{C}
\end{aligned}
$$

Find
(i) Q

## Solution

$$
\begin{aligned}
& Q=\frac{(\Delta T) \text { overall }}{E R \text { Rh }}=\frac{T_{1}-T_{3}}{\mathrm{R}_{\mathrm{th} 1}-\mathrm{R}_{\mathrm{th} 2}} \\
& \mathrm{R}_{\mathrm{th} 1}=\frac{L 1}{k 1 A}=\frac{0.20 \times 10^{-3}}{58 \times 1}=3.45 \mathrm{X}^{10-4}{ }^{0} \mathrm{C} / \mathrm{W} \\
& \mathrm{R}_{\mathrm{th} 2}=\frac{L 2}{k 2 A}=\frac{5 \times 10^{-3}}{0.116 \times 1}=0.043{ }^{0} \mathrm{C} / \mathrm{W} \\
& \quad Q=\frac{300-50}{3.45 \times 10-4+0.043}=5767.8 \mathrm{~W} \\
& \mathrm{Q}=5767.8 \mathrm{~W}
\end{aligned}
$$

7. A spherical shaped vessel of 1.2 m diameter is $\mathbf{1 0 0} \mathrm{mm}$ thick. Find the rate of heat leakage, if the temperature difference between the inner and outer surfaces is $200^{\circ} \mathrm{C}$. Thermal conductivity of material is $0.3 \mathrm{~kJ} / \mathrm{mh}^{\circ} \mathrm{C}$.

Given

$$
\begin{aligned}
\mathrm{d}_{1} & =1.2 \mathrm{~m} \\
\mathrm{r}_{1} & =0.6 \mathrm{~m} \\
\mathrm{r}_{2} & =\mathrm{r}_{1}+\text { thick } \\
& =0.6+0.1 \\
\mathrm{r}_{2} & =0.7 \mathrm{~m} \\
\Delta T & =200^{\circ} \mathrm{C} \\
\mathrm{~K} & =0.3 \mathrm{~kJ} / \mathrm{mhr}{ }^{\circ} \mathrm{C}=0.0833 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}
\end{aligned}
$$

Find
Q

Solution:

$$
\begin{gathered}
Q=\frac{\Delta T}{R_{t h}}=\frac{T_{1}-T_{2}}{R_{t h}} \\
R_{t h}=\frac{r_{2}-r_{1}}{4 \pi r_{2} r_{1}}=\frac{(0.7-0.6)}{4 \pi \times 0.0833 \times 0.6 \times 0.7}=0.2275 \mathrm{~K} / \mathrm{W} \\
Q=\frac{\Delta T}{R_{t h}}=\frac{200}{0.2275}=879.132 \mathrm{~W}
\end{gathered}
$$

November 2011 (old regulation)
8. A steel pipe $(K=45.0 \mathrm{~W} / \mathrm{m} . \mathrm{K})$ having a 0.05 m O.D is covered with a 0.042 m thick layer of magnesia ( $K=0.07 \mathrm{~W} / \mathrm{m} . \mathrm{K}$ ) which in turn covered with a 0.024 m layer of fiberglass insulation ( $K=0.048 \mathbf{W} / \mathrm{m} . \mathrm{K}$ ). The pipe wall outside temperature is $\mathbf{3 7 0} \mathbf{K}$ and the outer surface temperature of the fiberglass is 305 K . What is the interfacial temperature between the magnesia and fiberglass? Also calculate the steady state heat transfer.

## Given:

$\mathrm{OD}=0.05 \mathrm{~m}$
$\mathrm{d}_{1}=0.05 \mathrm{~m}$
$\mathrm{r}_{1}=0.025 \mathrm{~m}$
$\mathrm{k}_{1}=45 \mathrm{~W} / \mathrm{mK}$
$\mathrm{r}_{2}=\mathrm{r}_{1}+$ thick of insulation 1
$\mathrm{r}_{2}=0.025+0.042$
$\mathrm{r}_{2}=0.067 \mathrm{~m}$
$\mathrm{k}_{2}=0.07 \mathrm{~W} / \mathrm{mK}$

$$
\begin{aligned}
\mathrm{k}_{3} & =0.048 \mathrm{~W} / \mathrm{mK} \\
\mathrm{r}_{3} & =\mathrm{r}_{2}+\text { thick of insulation } 2 \\
& =0.067+0.024 \\
\mathrm{r}_{3} & =0.091 \mathrm{~m} \\
\mathrm{~T}_{1} & =370 \mathrm{~K} \\
\mathrm{~T}_{3} & =305 \mathrm{~K}
\end{aligned}
$$

## To find

(i) $\mathrm{T}_{2}$
(ii) Q

## Solution

Here thickness of pipe is not given; neglect the thermal resistance of pipe.

$$
Q=\frac{(\Delta T) \text { overall }}{\Sigma R t h}
$$

Here

$$
\begin{aligned}
& \quad(\Delta T) \text { overall }=T_{1}-T_{3}=370-305=65 \mathrm{~K} \\
& \Sigma \mathrm{R}_{\mathrm{th}}=\mathrm{R}_{\mathrm{th} 1}+\mathrm{R}_{\mathrm{th} 2} \\
& R_{\text {th1 } 1}=\frac{\ln \left(\frac{r_{2}}{r_{1}}\right)}{2 \pi k_{2 L}}=\frac{\ln \left(\frac{0.067}{0.025}\right)}{2 \pi \times 0.07 \times 1}=2.2414 \mathrm{~K} / \mathrm{W} \\
& R_{\text {th2 } 2}=\frac{\ln \left(\frac{r_{3}}{r_{2}}\right)}{2 \pi k_{3 L}}=\frac{\ln \left(\frac{0.091}{0.067}\right)}{2 \pi \times 0.48 \times 1}=1.0152 \mathrm{~K} / \mathrm{W} \\
& \mathrm{Q}=\frac{65}{2.2414+1.0152}=19.959 \mathrm{~W} / \mathrm{m}
\end{aligned}
$$

To find $\mathrm{T}_{2}$

$$
Q=\frac{T_{1}-T_{2}}{R_{t h 1}}
$$

$$
\begin{aligned}
& \mathrm{T}_{2}=\mathrm{T}_{1}-\left[\mathrm{Q} \times R_{t h 1}\right] \\
& \quad=370-[19.959 \times 2.2414] \\
& \mathrm{T}_{3}=325.26 \mathrm{~K}
\end{aligned}
$$

9. A motor body is 360 mm in diameter (outside) and 240 mm long. Its surface temperature should not exceed $55{ }^{\circ} \mathrm{C}$ when dissipating 340W. Longitudinal fins of 15 mm thickness and 40 mm height are proposed. The convection coefficient is $40 \mathrm{~W} / \mathrm{m}^{2}{ }^{\circ} \mathrm{C}$. determine the number of fins required. Atmospheric temperature is $\mathbf{3 0}^{\mathbf{}} \mathbf{C}$. thermal conductivity $=40 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$.

## Given:

$$
\begin{array}{lll}
\mathrm{D} & = & 360 \times 10^{-3} \mathrm{~m} \\
\mathrm{~L} & = & 240 \times 10^{-3} \mathrm{~m} \\
\mathrm{~T}_{\mathrm{b}} & = & 55^{\circ} \mathrm{C} \\
\mathrm{Q}_{\text {generating }} & = & 340 \mathrm{~W}
\end{array}
$$

Longitudinal fin

$$
\begin{aligned}
\mathrm{t}_{\text {fin }} & =15 \times 10^{-3} \mathrm{~m} \\
\mathrm{~h}_{\mathrm{fin}} & =40 \times 10^{-3} \mathrm{~m} \\
\mathrm{~h} & =40 \mathrm{~W} / \mathrm{m}^{20} \mathrm{C} \\
\mathrm{k} & =40 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C} . \\
\mathrm{T} \infty & =30^{\circ} \mathrm{C}
\end{aligned}
$$

## To find:

No of fins required ( N )
Solution:
Here length (or) height of fin is given. It is short fin(assume end insulated)

$$
\mathrm{N}=\frac{Q_{\text {gen }}}{Q_{\text {per } f i n}}
$$

From HMT Data book,

$$
\begin{aligned}
Q & =\sqrt{h P k A}\left(T_{b}-t_{\infty}\right) \cdot \tan h(m L) \\
m & =\sqrt{\frac{h P}{k A}} m^{-1}
\end{aligned}
$$

Perimeter $(\mathrm{P})=2 \mathrm{~L}=2 \times 0.24=0.48 \mathrm{~m}$
( for longitudinal fin fitted on the cylinder)

$$
\begin{aligned}
& \text { Area }(\mathrm{A})=\mathrm{Lt}=0.24 \times 0.015 \\
& \mathrm{~A}=0.0036 \mathrm{~m}^{2} \\
& m=\sqrt{\frac{40 \times 0.48}{40 \times 0.0036}}=11.55 \mathrm{~m}^{-1} \\
& Q_{\text {fin }}=\sqrt{40 \times 0.48 \times 40 \times 0.0036}(55-30) \cdot \tan h(11.55 \times 0.04) \\
& \mathrm{Q}_{\text {fin }}=4.718 \mathrm{~W}
\end{aligned}
$$

$$
N=\frac{340}{4.718}=72.06=72 \text { fins } .
$$

## May 2012

10. A mild steel tank of wall thickness 10 mm contains water at $90^{\circ} \mathrm{C}$. The thermal conductivity of mild steel is $50 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$, and the heat transfer coefficient for inside and outside of the tank area are 2800 and $11 \mathrm{~W} / \mathrm{m}^{2}{ }^{\circ} \mathrm{C}$, respectively. If the atmospheric temperature is $20^{\circ} \mathrm{C}$, calculate
(i) The rate of heat loss per $\mathrm{m}^{2}$ of the tank surface area.
(ii) The temperature of the outside surface tank.

## Given

$$
\begin{aligned}
\mathrm{L} & =10 \times 10^{-3} \mathrm{~m} \\
\mathrm{~T}_{\mathrm{hf}} & =90{ }^{\circ} \mathrm{C} \\
\mathrm{k} & =50 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C} \\
\mathrm{~h}_{\mathrm{hf}} & =2800 \mathrm{~W} / \mathrm{m}^{2 \circ} \mathrm{C} \\
\mathrm{~h}_{\mathrm{cf}} & =11 \mathrm{~W} / \mathrm{m}^{2}{ }^{\circ} \mathrm{C} \\
\mathrm{~T}_{\mathrm{cf}} & =20^{\circ} \mathrm{C}
\end{aligned}
$$

## To find

(i) $\mathrm{Q} / \mathrm{m}^{2}$
(ii) $\mathrm{T}_{2}$

Solution

$$
Q=\frac{(\Delta T) \text { overall }}{\text { ERth }}
$$

Here $(\Delta \mathrm{T})_{\text {overall }}=\mathrm{T}_{\mathrm{hf}}-\mathrm{T}_{\mathrm{cf}}=90-20=70^{\circ} \mathrm{C}$

$$
\begin{gathered}
\sum R_{t h}=R_{t h_{c o n v}{ }_{h f}}+R_{t h 1}+R_{t h_{c o n v}^{c f}} \\
R_{t h_{c o n v}}=\frac{1}{h_{h f} \cdot A}=\frac{1}{2800 \times 1} 0.00036 \mathrm{~K} / \mathrm{W} \\
R_{t h}=\frac{L}{k A}=\frac{10 \times 10^{-3}}{50 \times 1}=0.0002 \mathrm{~K} / \mathrm{W} \\
R_{t h_{c o n v_{c f}}}=\frac{1}{h_{c f} \cdot A}=\frac{1}{11 \times 1} 0.09091 \mathrm{~K} / \mathrm{W} \\
Q=\frac{70}{0.091469}=765.29 \mathrm{~W} / \mathrm{m}^{2}
\end{gathered}
$$

To find $\mathrm{T}_{2}$

$$
\begin{gathered}
Q=\frac{T_{h f}-T_{2}}{R_{\text {conv }}^{v_{f f}+R_{t h 1}}} \\
T_{2=} T_{h f}-\left[Q \times R_{\text {conv }_{h f}+R_{t h 1}}\right] \\
=90-[765 \mathrm{x} 0.00056]
\end{gathered}
$$

$$
\mathrm{T}_{2}=89.57^{\circ} \mathrm{C}
$$

11. A 15 cm outer diameter steam pipe is covered with 5 cm high temperature insulation ( $k=0.85 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ ) and 4 cm of low temperature $\left(k=0.72 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}\right)$. The steam is at $500{ }^{\circ} \mathrm{C}$ and ambient air is at $40{ }^{\circ} \mathrm{C}$. Neglecting thermal resistance of steam and air sides and metal wall calculate the heat loss from 100 m length of the pipe. Also find temperature drop across the insulation.

## Given

$$
\begin{array}{ll}
\mathrm{d}_{1} & =15 \mathrm{~cm} \\
\mathrm{r}_{1} & =7.5 \times 10^{-2} \mathrm{~m} \\
\mathrm{r}_{2} & =\mathrm{r}_{1}+\text { thick of high temperature insulation } \\
\mathrm{r}_{2} & =7.5+5=12.5 \times 10^{-2} \mathrm{~m} \\
\mathrm{r}_{3} & =\mathrm{r}_{2}+\text { thick of low temperature insulation } \\
\mathrm{r}_{3} & =12.5+4=16.5 \times 10^{-2} \mathrm{~m} \\
\mathrm{k}_{\text {ins } 1} & =0.85 \mathrm{w} / \mathrm{m}^{\circ} \mathrm{C} \\
\mathrm{k}_{\text {ins } 2} & =0.72 \mathrm{w} / \mathrm{m}^{\circ} \mathrm{C} \\
\mathrm{~T}_{\text {hf }} & =500^{\circ} \mathrm{C} \\
\mathrm{~T}_{\text {cf }} & =40^{\circ} \mathrm{C}
\end{array}
$$

To find
(i) Q if $\mathrm{L}=1000 \mathrm{~mm}=1 \mathrm{~m}$

Solution:

$$
Q=\frac{(\Delta T) \text { overall }}{\Sigma R \text { Rth }}
$$

Here

$$
\begin{gathered}
\Delta \mathrm{T}=\mathrm{T}_{1}-\mathrm{T}_{3} \\
\Sigma \mathrm{R}_{\mathrm{th}}=\mathrm{R}_{\mathrm{th} 1}+\mathrm{R}_{\mathrm{th} 2} \\
R_{\text {th } 1}=\frac{\ln \left(\frac{r_{2}}{r_{1}}\right)}{2 \pi k_{1 L}}=\frac{\ln \left(\frac{0.125}{0.075}\right)}{2 \pi \times 0.85 \times 1}=0.09564 \mathrm{~K} / \mathrm{W} \text { or }{ }^{\circ} \mathrm{C} / \mathrm{W} \\
R_{\text {th } 2}=\frac{\ln \left(\frac{r_{3}}{r_{2}}\right)}{2 \pi k_{2 L}}=\frac{\ln \left(\frac{0.165}{0.125}\right)}{2 \pi \times 0.72 \times 1}=0.06137 \mathrm{~K} / \mathrm{W} \text { or }{ }^{\circ} \mathrm{C} / \mathrm{W} \\
\mathrm{Q}=\frac{500-40}{0.09564+0.06137}=2929.75 \mathrm{~W} / \mathrm{m}
\end{gathered}
$$

12. Determine the heat transfer through the composite wall shown in the figure below. Take the conductives of $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D} \& \mathrm{E}$ as $50,10,6.67,20 \& 30 \mathrm{~W} / \mathrm{mK}$ respectively and assume one dimensional heat transfer. Take of area of $A=D=E=\mathbf{1 m} \mathbf{m}^{\mathbf{2}}$ and $B=\mathbf{C = 0 . 5} \mathbf{m}^{\mathbf{2}}$. Temperature entering at wall A is $800^{\circ} \mathrm{C}$ and leaving at wall E is $100^{\circ} \mathrm{C}$.

|  |  |  |  |
| :--- | :---: | :---: | :---: |
| A | B | D | E |
|  | C |  |  |

## Given:

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{i}}=800^{\circ} \mathrm{C} \\
& \mathrm{~T}_{\mathrm{o}}=100^{\circ} \mathrm{C} \\
& \mathrm{k}_{\mathrm{A}}=50 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{k}_{\mathrm{B}}=10 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{k}_{\mathrm{c}}=6.67 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{k}_{\mathrm{D}}=20 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{k}_{\mathrm{E}}=30 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{~A}_{\mathrm{A}}=\mathrm{A}_{\mathrm{D}}=\mathrm{A}_{\mathrm{E}}=1 \mathrm{~m}^{2} \\
& \mathrm{~A}_{\mathrm{B}}=\mathrm{A}_{\mathrm{C}}=0.5 \mathrm{~m}^{2}
\end{aligned}
$$

Find
(i) $\quad \mathrm{Q}$

## Solution

$$
\begin{aligned}
& Q=\frac{(\Delta T) \text { overall }}{\text { RRth }} \\
& \quad R_{t h 1}=R_{t h A}=\frac{L_{A}}{k_{A} A}
\end{aligned}
$$

Parallel $\quad \frac{1}{R_{t h 2}}=\frac{1}{R_{t h B}}+\frac{1}{R_{t h C}}=\frac{R_{t h B}+R_{t h C}}{R_{t h B} R_{t h C}}$

$$
\begin{gathered}
R_{t h 2}=\frac{R_{t h B} R_{t h C}}{R_{t h B}+R_{t h C}} \\
R_{t h B}=\frac{L_{B}}{k_{B} A_{B}} \\
R_{t h C}=\frac{L_{C}}{k_{C} A_{C}} \\
R_{t h 4}=R_{t h E}=\frac{L_{E}}{k_{E} A_{E}} \\
R_{t h 3}=R_{t h D}=\frac{L_{D}}{k_{D} A_{D}} \\
R_{t h 1}=R_{t h A}=\frac{1}{50 \times 1}=0.02 \mathrm{~K} / \mathrm{W}
\end{gathered}
$$

$$
\begin{gathered}
R_{t h B}=\frac{1}{10 \times 0.5}=0.2 \mathrm{~K} / \mathrm{W} \\
R_{t h C}=\frac{1}{6.67 \times 0.5}=0.2969 \mathrm{~K} / \mathrm{W} \\
R_{t h 2}=\frac{R_{t h B} R_{t h C}}{R_{t h B}+R_{t h C}}=\frac{0.2 \times 0.299}{0.2+0.299}=\frac{0.0598}{0.499} \\
R_{t h 2}=0.1198 \mathrm{~K} / \mathrm{W} \\
R_{t h 3}=R_{t h D}=\frac{L_{D}}{K_{D} A_{D}}=\frac{1}{20 \times 1}=0.05 \mathrm{~K} / \mathrm{W} \\
R_{t h 4}=R_{t h E}=\frac{L_{E}}{K_{E} A_{E}}=\frac{1}{30 \times 1}=0.0333 \mathrm{~K} / \mathrm{W} \\
Q=\frac{T_{i}-T_{o}}{\sum R_{t h}}=\frac{800-100}{0.02+0.1198+0.05+0.0333}=3137.61 \mathrm{~W} \\
Q=3137.61 \mathrm{~W}
\end{gathered}
$$

13. A long carbon steel rod of length 40 cm and diameter $10 \mathrm{~mm}(k=40 \mathrm{w} / \mathrm{mK})$ is placed in such that one of its end is $400^{\circ} \mathrm{C}$ and the ambient temperature is $30^{\circ} \mathrm{C}$. the flim co-efficient is $10 \mathrm{w} / \mathrm{m}^{2} \mathrm{~K}$. Determine
(i) Temperature at the mid length of the fin.
(ii) Fin efficiency
(iii) Heat transfer rate from the fin
(iv) Fin effectiveness

## Given:

$$
\begin{aligned}
& l=40 \times 10^{-2} \mathrm{~m} \\
& \mathrm{~d}=10 \times 10^{-3} \mathrm{~m} \\
& \mathrm{k}=40 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{~T}_{\mathrm{b}}=400^{\circ} \mathrm{C} \\
& \mathrm{~T}_{\infty}=30^{\circ} \mathrm{C} \\
& \mathrm{H}=10 \mathrm{w} / \mathrm{m}^{2} \mathrm{~K}
\end{aligned}
$$

## To find

(i) $\mathrm{T}, \mathrm{x}=\mathrm{L} / 2$
(ii) $\eta_{\text {fin }}$
(iii) $\mathrm{Q}_{\text {fin }}$

## Solution

It is a short fin end is insulated
From H.M.T Data book

$$
Q=\sqrt{h P k A}\left(T_{b}-T_{\infty}\right) \cdot \tan h(m L)
$$

$$
m=\sqrt{\frac{h P}{k A}} m^{-1}
$$

$$
\begin{gathered}
\text { Perimeter }=\pi \mathrm{d}=\pi \times 10 \times 10^{-3}=0.0314 \mathrm{~m} \\
\qquad \begin{array}{c}

& \mathrm{k}_{2}=5.8 \mathrm{~W} / \mathrm{m}^{0} \mathrm{C} \\
& \mathrm{~T}_{1}=725^{\circ} \mathrm{C} \\
& \mathrm{~T}_{4}=110^{\circ} \mathrm{C} \\
& \left(R_{\text {th }}\right)_{\text {contact }}=0.0035^{\circ} \mathrm{C} / \mathrm{W} \\
& \text { Area }=1 \mathrm{~m}^{2}
\end{aligned}
$$

Find
(i) Q

Solution

$$
\begin{gathered}
Q=\frac{(\Delta T) \text { overall }}{\Sigma \text { Rth }}=\frac{T_{1}-T_{4}}{\text { Rth } 1+\left(R_{\text {th }}\right)_{\text {cont }}+\mathrm{Rth} 2} \\
{\text { Here } \mathrm{T}_{1}-\mathrm{T}_{4}=725-110=615^{\circ} \mathrm{C}}_{\mathrm{R}_{\mathrm{th} 1}=}^{L \frac{L 1}{k 1 A}=\frac{120 \times 10^{-3}}{1.7 \times 1}=0.0706^{0} \mathrm{C} / \mathrm{W}} \\
\mathrm{R}_{\text {th } 2}=\frac{L 2}{k 2 A}=\frac{240 \times 10^{-3}}{5.8 \times 1}=0.0414^{\circ} \mathrm{C} / \mathrm{W} \\
Q=\frac{615}{0.0706+0.0035+0.0414}=5324.67 \mathrm{~W} / \mathrm{m}^{2} \\
\mathrm{Q}=5324.67 \mathrm{~W} / \mathrm{m}
\end{gathered}
$$

15. A furnace walls made up of three layers, one of fire brick, one of insulating brick and one of red brick. The inner and outer surfaces are at $870^{\circ} \mathrm{C}$ and $40^{\circ} \mathrm{C}$ respectively. The respective co- efficient of thermal conduciveness of the layer are $\mathbf{1 . 0}, \mathbf{0 . 1 2}$ and $\mathbf{0 . 7 5}$ $W / m K$ and thicknesses are $\mathbf{2 2} \mathbf{~ c m}, 7.5$, and 11 cm . assuming close bonding of the layer at their interfaces, find the rate of heat loss per sq.meter per hour and the interface temperatures.

## Given

Composite wall (without convection)

$$
\begin{aligned}
& \mathrm{L}_{1}=22 \times 10^{-2} \mathrm{~m} \\
& \mathrm{k}_{1}=1 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{~L}_{2}=7.5 \times 10^{-2} \mathrm{~m} \\
& \mathrm{k}_{2}=0.12 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{~L}_{3}=11 \times 10^{-2} \mathrm{~m} \\
& \mathrm{k}_{3}=0.75 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{~T}_{1}=870^{\circ} \mathrm{C} \\
& \mathrm{~T}_{4}=40^{\circ} \mathrm{C}
\end{aligned}
$$

Find
(i)
Q / hr
(ii) $\mathrm{T}_{2}, \mathrm{~T}_{3}$

## Solution

We know that,

$$
Q=\frac{(\Delta T) \text { overall }}{\Sigma R t h}
$$

Here

$$
\begin{aligned}
& (\Delta \mathrm{T}) \text { overall }=\mathrm{T}_{1-} \mathrm{T}_{4} \\
& =870-40
\end{aligned}
$$

$=830^{\circ} \mathrm{C}$
And $\quad \Sigma \mathrm{R}_{\mathrm{th}}=\mathrm{R}_{\mathrm{th} 1}+\mathrm{R}_{\mathrm{th} 2}+\mathrm{R}_{\mathrm{th} 3}$

$$
\text { (assume } \mathrm{A}=1 \mathrm{~m}^{2} \text { ) }
$$

$$
\mathrm{R}_{\mathrm{th} 1}=\frac{L 1}{k 1 A}=\frac{22 \times 10-2}{1 \times 1}=22 \times 10^{-2} \mathrm{~K} / \mathrm{W}
$$

$$
\mathrm{R}_{\mathrm{th} 2}=\frac{L 2}{k 2 A}=\frac{7.5 \times 10-2}{0.12 \times 1}=0.625 \mathrm{~K} / \mathrm{W}
$$

$$
\mathrm{R}_{\mathrm{th} 3}=\frac{L 3}{k 3 A}=\frac{11 \times 10-2}{0.75 \times 1}=0.1467 \mathrm{~K} / \mathrm{W}
$$

$$
Q=\frac{T 1-T 4}{R t h 1+R t h 2+R t h 3}
$$

$$
=\frac{870-40}{0.9917}
$$

$$
\begin{aligned}
& \mathrm{Q}=836.95 \mathrm{~W} / \mathrm{m}^{2} \\
& \mathrm{Q}=3.01 \times 10^{5} \mathrm{~J} / \mathrm{h}
\end{aligned}
$$

Nov 2010
16. A $\mathbf{1 2} \mathbf{~ c m}$ diameter long bar initially at a uniform temperature of $40^{\circ} \mathrm{C}$ is placed in a medium at $650^{\circ} \mathrm{C}$ with a convective co efficient of $22 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$ calculate the time required for the bar to reach $255^{\circ} \mathrm{C}$. Take $\mathrm{k}=20 \mathrm{~W} / \mathrm{mK}, \rho=580 \mathrm{~kg} / \mathrm{m}^{3}$ and $\mathrm{c}=1050 \mathrm{~J} / \mathrm{kg} \mathrm{K}$.

## Given : Unsteady state

$$
\begin{aligned}
& \mathrm{D}=12 \mathrm{~cm}=0.12 \mathrm{~m} \\
& \mathrm{R}=0.06 \mathrm{~m} \\
& \mathrm{~T}_{\mathrm{o}}=40+273=313 \mathrm{~K} \\
& \mathrm{~T}_{\infty}=650+273=923 \mathrm{~K} \\
& \mathrm{~T}=255+273=528 \mathrm{~K} \\
& \mathrm{~h}=22 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
& \mathrm{k}=20 \mathrm{~W} / \mathrm{mK} \\
& \rho=580 \mathrm{Kg} / \mathrm{m}^{3} \\
& \mathrm{c}=1050 \mathrm{~J} / \mathrm{kg} \mathrm{~K}
\end{aligned}
$$

## Find:

Time required to reach $255^{\circ} \mathrm{C}(\tau)$

## Solution

Characteristic length for cylinder $=L_{c}=\frac{\mathrm{R}}{2}$

$$
\mathrm{L}_{\mathrm{c}}=\frac{0.06}{2}=0.03 \mathrm{~m}
$$

We know that

$$
\begin{aligned}
B_{i} & =\frac{h L_{c}}{k}=\frac{22 \times 0.03}{20} \\
\mathrm{~B}_{\mathrm{i}} & =0.033<0.1
\end{aligned}
$$

Biot number is less than 0.1. Hence this is lumped heat analysis type problem.
For lumped heat parameter, from HMT data book.

$$
\frac{T-T_{\infty}}{T_{o}-T_{\infty}}=e^{\left[-\frac{h A}{c V \rho} \times \tau\right]}
$$

We know that

$$
\begin{aligned}
& L_{c}=\frac{V}{A} \\
& \frac{T-T_{\infty}}{T_{o}-T_{\infty}}=e^{\left[\frac{-h}{c L_{c} \rho} \times \tau\right]} \\
& \frac{528-923}{313-923}=e^{\left[\frac{-22}{1050 \times 0.03 \times 580} \times \tau\right]} \\
& \ln \left[\frac{528-923}{313-923}\right]=\frac{22}{1050 \times 0.03 \times 580} \times \tau \\
& \tau=360.8 \mathrm{sec}
\end{aligned}
$$

17. A aluminium sphere mass of 5.5 kg and initially at a temperature of $290^{\circ} \mathrm{Cis}$ suddenly immersed in a fluid at $15{ }^{\circ} \mathrm{C}$ with heat transfer co efficient $58 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. Estimate the time required to cool the aluminium to $95^{\circ} \mathrm{C}$ for aluminium take $\rho=2700$ $\mathbf{k g} / \mathrm{m}^{3}, \mathrm{c}=\mathbf{9 0 0} \mathbf{J} / \mathrm{kg} \mathrm{K}, \mathrm{k}=205 \mathrm{~W} / \mathrm{mK}$.

Given:

$$
\begin{aligned}
& \mathrm{M}=5.5 \mathrm{~kg} \\
& \mathrm{~T}_{\mathrm{o}}=290+273=563 \mathrm{~K} \\
& \mathrm{~T}_{\infty}=15+273=288 \mathrm{~K} \\
& \mathrm{~T}=95+273=368 \mathrm{~K} \\
& \mathrm{~h}=58 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
& \mathrm{k}=205 \mathrm{~W} / \mathrm{mK} \\
& \rho=2700 \mathrm{~kg} / \mathrm{m}^{3} \\
& \mathrm{c}=900 \mathrm{j} / \mathrm{kg} \mathrm{~K}
\end{aligned}
$$

## To find:

Time required to cool at $95^{\circ} \mathrm{C}(\tau)$

## Solution

$$
\begin{aligned}
& \text { Density }=\rho=\frac{\text { mass }}{\text { volume }}=\frac{\mathrm{m}}{\mathrm{v}} \\
& V=\frac{m}{p}=\frac{5.5}{2700} \\
& \mathrm{~V}=2.037 \times 10^{-33}
\end{aligned}
$$

For sphere,

$$
\begin{aligned}
& \text { Characteristic length } L_{c}=\frac{R}{3} \\
& \text { Volume of sphere } \\
& V=\frac{4}{3} \pi R^{3} \\
& R=\sqrt[3]{\frac{3 V}{4 \pi}} \\
& =\sqrt[3]{\frac{3 \times 2.03 \times 10^{-3}}{4 \pi}} \\
& \mathrm{R}=0.0786 \mathrm{~m} \\
& L_{c}=\frac{0.0786}{3}=0.0262 \mathrm{~m}
\end{aligned}
$$

Biot number $B_{i}=\frac{h L_{c}}{k}$

$$
\begin{array}{r}
\quad=\frac{58 \times 0.0262}{205} \\
\mathrm{~B}_{\mathrm{i}}=7.41 \times 10^{-3}<0.1
\end{array}
$$

$\mathrm{B}_{\mathrm{i}}<0.1$ this is lumped heat analysis type problem.

## UNIT II CONVECTION

The process of heat transfer between a surface and a fluid flowing in contact with it is called convection. If the flow is caused by an external device like a pump or blower, it is termed as forced convection. If the flow is caused by the buoyant forces generated by heating or cooling of the fluid the process is called as natural or free convection.
In the previous chapters the heat flux by convection was determined using equation

$$
\mathrm{q}=\mathrm{h}\left(\mathrm{~T}_{\mathrm{s}}-\mathrm{T}_{\infty}\right)
$$

q is the heat flux in $\mathrm{W} / \mathrm{m}^{2}, \mathrm{~T}_{\mathrm{s}}$ is the surface temperature and $\mathrm{T}_{\infty}$ is the fluid temperature of the free stream, the unit being ${ }^{\circ} \mathrm{C}$ or K . Hence the unit of convective heat transfer coefficient h is $\mathrm{W} / \mathrm{m}^{2} \mathrm{~K}$ or $\mathrm{W} / \mathrm{m}^{2}{ }^{\circ} \mathrm{C}$ both being identically the same. In this chapter the basic mechanism of convection and the method of analysis that leads to the correlations for convection coefficient are discussed. In this process the law of conservation of mass, First law of themodynamics and Newtons laws of motion are applied to the system.

## THE CONCEPT OF VELOCITY BOUNDARY LAYER

We have seen that in the determination of the convective heat transfer coefficient the key is the determination of the temperature gradient in the fluid at the solid-fluid interface. The velocity gradient at the surface is also involved in the determinations. This is done using the boundary layer concept to solve for $u=f(y), T=f^{\prime}(y)$. The simplest situation is the flow over a flat plate. The fluid enters with a uniform velocity of $u_{\infty}$ as shown in Fig. When fluid particles touch the surface of the plate the velocity of these particles is reduced to zero due to viscous forces. These particles in turn retard the velocity in the next layer, but as these two are fluid layers, the velocity is not reduced to zero in the next layer. This retardation process continues along the layers until at some distance $y$ the scale of retardation becomes negligible and the velocity of the fluid is very nearly the same as free stream velocity $u$ at this level. The retardation is due to shear stresses along planes parallel to the flow.
The value of $\boldsymbol{y}$ where velocity $\boldsymbol{u}=\mathbf{0 . 9 9} \boldsymbol{u} \propto$ is called hydrodynamic boundary layer thickness denoted by $\delta$. The velocity profile in the boundary layer depicts the variation of $u$ with $y$, through the boundary layer. This is shown in Fig.

The model characterizes the flow as consisting of two distinct regions (i) a thin boundary layer in which the velocity gradients and shear stresses are large and (ii) the remaining region outside of the boundary layer where the velocity gradients and shear stresses are negligibly small. This is also called potential flow. The boundary layer thickness increases along the direction of flow over a flat plate as effects of viscous drag is felt farther into the free stream. This is called the velocity boundary layer model as this describes the variation of velocity in the boundary layer. The direct application of velocity boundary layer is in fluid mechanics for the determination of the wall shear stress and then the dimensionless drag coefficient. The net shear over the plate in flow is the wall shear and shear stress beyond the boundary layer is zero.
The wall shear is given by the equation

$$
\tau_{s}=\left.\mu \frac{\partial u}{\partial y}\right|_{y=0}
$$

It may be seen that the velocity gradient can be determined if a functional relationship such as $u=f(y)$ is available. Such a relationship is obtained using the boundary layer model and applying the continuity and Newtons laws of motion to the flow. The friction coefficient $C_{f}$ is defined as below.

$$
C_{f}=\tau_{s} /\left(\rho u_{\infty}^{2 / 2)}\right.
$$

There are local and average values for both $\tau_{s}$ and $C_{f}$ denoted as $\tau_{s . x} \bar{\tau}_{s} C_{f x}$ and $\overline{C_{f}}$. In heat transfer the friction coefficient by analogy is found to provide a value for Nusselt number and hence its importance. Measured values of $C_{f}$ are also available for various values of an important parameter, namely Reynolds number. Curve fitted equations are also available for $c f$.

## THERMAL BOUNDARY LAYER

Velocity boundary layer automatically forms when a real fluid flows over a surface, but thermal boundary layer will develop only when the fluid temperature is different from the surface temperature. Considering the flow over a flat plate with fluid temperature of $T_{\infty}$ and surface temperature $T_{s}$ the temperature of the fluid is $T_{\infty}$ all over the flow till the fluid reaches the leading edge of the surface. The fluid particles coming in contact with the surface is slowed down to zero velocity and the fluid layer reaches equilibrium with the surface and reaches temperature $T_{s}$. These particles in turn heat up the next layer and a tmperature gradient develops. At a distance $y$, the temperature gradient becomes negligibly small. The distance $y$ at which the ratio $\left[\left(T_{s}-T\right) /\left(T_{s}-T_{\infty}\right)\right]=0.99$ is defined as thermal boundary layer thickness $\delta t$. The flow can now be considered to consist of two regions.

A thin layer of thickness $\delta_{t}$ in which the temperature gradient is large and the remaining flow where the temperature gradient is negligible. As the distance from the leading edge increases the effect of heat penetration, increases and the thermal boundary layer thickness increases. The heat flow from the surface to the fluid can be calculated using the temperature gradient at the surface. The temperature gradient is influenced by the nature of free stream flow. The development of the thermal boundary layer is shown in Fig.

The thermal and velocity boundary layers will not be identical except in a case where $\operatorname{Pr}=1$. Additional influencing factors change the thickness of the thermal boundary layer as compared to the thickness of the velocity boundary layer at any location. Note that both boundary layers exist together. Similar development of boundary layer is encountered in convective mass transfer also.

## LAMINAR AND TURBULENT FLOW

The formation of the boundary layer starts at the leading edge. In the starting region the flow is well ordered. The streamlines along which particles move is regular. The velocity at any point remains steady. This type of flow is defined as laminar flow. There is no macroscopic mixing between layers. The momentum or heat transfer is mainly at the molecular diffusion level. After some distance in the flow, macroscopic mixing is found to occur. Large particles of fluid is found to move from one layer to another. The motion of particles become irregular. The velocity at any location varies with respect to a mean value. The flow is said to be turbulent. Due to the mixing the boundary layer thickness is larger. The energy flow rate is also higher. The velocity and temperature profiles are flatter, but the gradient at the surface is steeper due to the same reason. This variation is shown in Fig.

$$
\operatorname{Re}_{x}=\rho u_{\infty} x / \mu \quad \text { or } \quad u_{\infty} x / v
$$

The changeover does not occur at a sharp location. However for calculations some location has to be taken as the change over point. In the velocity boundary layer, this transition is determined by a dimensionless group, Reynolds number-defined for flow over a plate by the equation For flow in a tube or across a tube or sphere it is given by the equation.

$$
R e=\rho u_{\infty} D / \mu \quad \text { or } \quad u_{\infty} D / v
$$

The grouping represents the ratio of inertia and viscous forces. Up to a point the inertia forces keep the flow in order and laminar flow exists. When the viscous forces begin to predominate, movement of particles begin to be more random and turbulence prevails. The transition Reynolds number for flow over a flat plate depends on many factors and may be anywhere from 105 to $3 \times 10^{6}$. Generally the value is taken as $\mathbf{5} \times \mathbf{1 0}^{5}$ unless otherwise specified.

For flow through tubes the transition value is $\mathbf{2 3 0 0}$, unless otherwise specified. In the quantitative estimation of heat flow, the correlation equations for the two regions are distinctly different and hence it becomes necessary first to establish whether the flow is laminar or turbulent. Turbulent flow is more complex and exact analytical solutions are difficult to obtain. Analogical model is used to obtain solutions.

## FORCED AND FREE CONVECTION

When heat transfer occurs between a fluid and a surface, if the flow is caused by a fan, blower or pump or a forcing jet, the process is called forced convection. The boundary layer development is similar to the descripitions in the previous section. When the temperature of a surface immersed in a stagnant fluid is higher than that of the fluid, the layers near the surface get heated and the density decreases in these layers.

The surrounding denser fluid exerts buoyant forces causing fluid to flow upwards near the surface. This process is called free convection flow and heating is limited to a layer, as shown in Fig. The heat transfer rate will be lower as the velocities and temperature gradients are lower. If the surface temperature is lower, the flow will be in the downward direction.

FLOW OVER FLAT PLATES

In this chapter additional practical correlations are introduced. Though several types of boundary conditions may exist, these can be approximated to three basic types. These are (i) constant wall temperature, (as may be obtained in evaporation, condensation etc., phase change at a specified pressure) (ii) constant heat flux, as may be obtained by electrical strip type of heating and (iii) flow with neither of these quantities remaining constant, as when two fluids may be flowing on either side of the plate.
Distinct correlations are available for constant wall temperature and constant heat flux. But for the third case it may be necessary to approximate to one of the above two cases

## Laminar flow:

The condition is that the Reynolds number should be less than $5 \times 10^{5}$ or as may be stated otherwise. For the condition that the plate temperature is constant the following equations are valid with fluid property values taken at the film temperature.

Hydrodynamic boundary layer thickness

$$
\delta_{x}=5 x / R e_{x}^{0.5}
$$

Thermal boundary layer thickness

$$
\delta_{t x}=\delta_{x} \operatorname{Pr}^{-0.333}
$$

Displacement thickness and Momentum thickness are not directly used in heat transfer calculations. However, it is desirable to be aware of these concepts.

Displacement thickness is the difference between the boundary layer thickness and the thickness with uniform velocity equal to free stream velocity in which the flow will be the same as in the boundary layer. For laminar flow displacement thickness is defined as

$$
\begin{aligned}
& \int_{0}^{\delta}\left(1-\frac{u}{u_{\infty}}\right) d y \\
& \delta_{d}=\delta_{x} / 3
\end{aligned}
$$

Momentum thickness is the difference between the boundary layer thickness and the layer thickness which at the free stream velocity will have the same momentum as in the boundary layer.

Momentum thickness $\delta_{m}$ in the laminar region is defined by

$$
\begin{gathered}
\int_{0}^{\delta}\left[\frac{u}{u_{\infty}}-\left(\frac{u}{u_{\infty}}\right)^{2}\right] d y \\
\delta_{m}=\delta_{x} / 7
\end{gathered}
$$

Friction coefficient defined as $\tau s /\left(\rho u_{\infty}{ }^{2} / 2\right)$ is given by

$$
C_{f x}=0.664 R e_{x}^{-0.5}
$$

The average value of $C_{f}$ in the laminar region for a length $L$ from leading edge is given by

$$
C_{f L}=1.328 R e_{L}^{-0.5}
$$

The value of local Nusselt number is given by

$$
\begin{aligned}
& N u_{x}=0.332 R e_{x}^{0.5} \operatorname{Pr}^{0.33} \\
& \bar{N} u_{L}=2 N u L=0.664 \operatorname{Re}_{L}^{0.5} \operatorname{Pr}^{1 / 3}
\end{aligned}
$$

## TURBULENT FLOW

$R e_{x}>5 \times 10^{5}$ are as specified. In flow over flat plate, the flow is initially laminar and after some distance turns turbulent, the value of Reynolds number at this point being near $5 \times 10^{5}$. However, there are circumstances under which the flow turns turbulent at a very short distance, due to higher velocities or due to disturbances, roughness etc. The critical Reynolds number in these cases is low and has to be specified. In the turbulent region the velocity boundary layer thickness is given by

$$
\begin{aligned}
& \delta_{x}=0.381 x \times R e_{x}^{-0.2} \\
& \delta_{t} \approx \delta_{x}
\end{aligned}
$$

The displacement and momentum thickness are much thinner. The displacement thickness is

$$
\delta_{d}=\delta_{x} / 8
$$

## Momentum thickness is

$$
\delta_{m}=(7 / 72) \delta_{x}
$$

The local friction coefficient defined as $\tau_{w} /\left(\rho u_{*}{ }^{2} / 2\right)$ is given for the range $R e_{x}$ from $5 \times 10^{5}$ to $10^{7}$ by

$$
C_{f x}=0.0592 R e_{x}^{-0.2}
$$

For higher values of $R e$ in the range $10^{7}$ to $10^{\circ}$

$$
C_{f x}=0.37\left[\log _{10} R e_{x}\right]^{-2.584}
$$

The local Nusselt number is given by

$$
N u_{x}=0.0296 R e_{x}^{0.8} \operatorname{Pr}^{0.33}
$$

The average Nusselt number is given by

$$
\bar{N} u=0.037 \operatorname{Re}^{0.8} \operatorname{Pr}^{0.33}
$$

The assumption that the flow is turbulent althrough (from start) may not be acceptable in many situations. The average values are now found by integrating the local values up to the location where $\operatorname{Re}=5 \times 10^{5}$ using laminar flow relationship and then integrating the local value beyond this point using the turbulent flow relationship and then taking the average. This leads to the following relationship for constant wall temperature

$$
\begin{aligned}
\delta_{x} & =0.381 x \times R e_{x}^{-0.2}-10256 x \times R e_{x}^{-1.0} \\
C_{f L} & =0.074 R e_{L}^{0.2}-1742 R e_{L}^{-1.0}
\end{aligned}
$$

A more general relationship can be used for other values of critical Reynolds number.

$$
N u_{x}=\operatorname{Pr}^{0.333}\left[0.037 \operatorname{Re}_{L}{ }^{0.8}-871\right]
$$

## FLOW ACROSS CYLINDERS

The other type of flow over surfaces is flow across cylinders often met with in heat exchangers and hot or cold pipe lines in the open. An important difference is the velocity distribution along the flow. The obstruction by the cylinder causes a closing up of the streamlines and an increase in pressure at the stagnation point. The velocity distribution at various locations in the flow differs from the flow over a flat plate as shown in Fig.

That the averaging out the convection coefficient is difficult. The experimental values measured by various researchers plotted using common parameters Red and NuD (log log plot) is shown in Fig. 8.4. It can be seen that scatter is high at certain regions and several separate straight line correlations are possible for various ranges. Some
researchers have limited their correlations for specific ranges and specific fluids. Thus a number of correlations are available and are listed below.

A very widely used correlation is of the form

$$
N u_{D}=C R c_{D}{ }^{m} P^{0.333}
$$

Where $\mathbf{C}$ and $\boldsymbol{m}$ are tabulated below. The applicability of this correlation for very low values of Prandtl number is doubtful. The length parameter in Nusselt number is diameter $D$ and Nusselt number is referred as NuD.

The properties are to be evaluated at the film temperature

| $R e_{D}$ | $C$ | $m$ |
| :---: | :---: | :---: |
| $0.4-4.0$ | 0.989 | 0.330 |
| $4-40.0$ | 0.91 | 0.385 |
| $40-4000$ | 0.683 | 0.466 |
| $4000-40000$ | 0.193 | 0.618 |
| $40000-400000$ | 0.0266 | 0.805 |

## FLOW ACROSS SPHERES

There are a number of applications for flow over spheres in industrial processes. As in the case of flow across cylinders, the flow development has a great influence on heat transfer. Various correlations have been obtained from experimental measurements and these are listed in the following paras.

The following three relations are useful for air with $\operatorname{Pr}=0.71$ (1954)

$$
N u=0.37 \operatorname{Re} 0.617<R e<7000
$$

With Properties evaluated at film temperature.

## FLOW ACROSS BANK OF TUBES

In most heat exchangers in use, tube bundles are used with one fluid flowing across tube bundles. First it is necessary to define certain terms before discussing heat transfer calculations. Two types of tube arrangement are possible. (i) in line and (ii) staggered. The distance between tube centers is known as pitch. The pitch along the flow is known as $\left(S_{n}\right)$ and the pitch in the perpendicular direction is called $\left(S_{p}\right)$. These are shown in Fig.

Inline

Due to the obstruction caused by the tubes, the velocity near the tube increases and this increased value has to be used in the calculation of Reynolds number. In the case of in line the actual velocity near the tubes

$$
V_{\max }=\left[S_{p} /\left(S_{p}-D\right)\right] u_{\infty}
$$

In the case of staggered arrangement the larger of the value given by 8.53 and 8.54 is to be used

$$
V_{\max }=\left[S_{p} / 2\left(S_{\mathrm{D}}-D\right)\right] u_{\infty}
$$

where

$$
S_{D}=\left[S_{n}^{2}+\left(\frac{S_{p}}{2}\right)^{2}\right]^{0.5}
$$

This is because of the larger obstruction possible in the staggered arrangement.
For number of rows of tubes of 10 or more

$$
\begin{aligned}
N u & =1.33 C R e^{n} \cdot P^{0.33} \\
N & \geq 10,2000<R e
\end{aligned}
$$

Reynolds number to be calculated based on $V_{\text {max. }}$. The property values should be at $T_{f}$. The value of $C$ and $n$ are tabulated below in Table 8.1. For larger values of $S_{p} / D$, tubes can be considered as individual tubes rather than tube bank

| $S_{p} / D$ | $\begin{gathered} 1.25 \\ C \end{gathered}$ | $n$ | $\begin{gathered} 1.5 \\ C \end{gathered}$ | $n$ | $\begin{gathered} 2.0 \\ C \end{gathered}$ | $n$ | $\begin{gathered} 3.0 \\ C \end{gathered}$ | $n$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In line |  |  |  |  |  |  |  |  |
| 1.25 | 0.348 | 0.592 | 0.275 | 0.608 | 0.100 | 0.704 | 0.0633 | 0.752 |
| 1.5 | 0.367 | 0.586 | 0.250 | 0.620 | 0.101 | 0.702 | 0.0678 | 0.744 |
| 2.0 | 0.418 | 0.570 | 0.299 | 0.602 | 0.229 | 0.632 | 0.1980 | 0.648 |
| 3.0 | 0.290 | 0.601 | 0.357 | 0.584 | 0.374 | 0.581 | 0.2860 | 0.608 |
| Stagger |  |  |  |  |  |  |  |  |
| 0.6 | - |  | - | - | - | - | 0.213 | 0.636 |
| 0.9 | - | - | - | - | 0.446 | 0.571 | 0.401 | 0.581 |
| 1.0 |  | - | 0.497 | 0.558 | - | - | - | - |
| 1.125 | - |  |  | - | 0.478 | 0.565 | 0.518 | 0.560 |
| 1.25 | 0.518 | 0.556 | 0.505 | 0.554 | 0.519 | 0.556 | 0.552 | 0.562 |
| 1.5 | 0.451 | 0.568 | 0.460 | 0.562 | 0.452 | 0.568 | 0.488 | 0.568 |
| 2.0 | 0.404 | 0.572 | 0.416 | 0.568 | 0.482 | 0.556 | 0.449 | 0.570 |
| 0.3 | 0.310 | 0.592 | 0.356 | 0.580 | 0.440 | 0.562 | 0.421 | 0.574 |

## FORCED CONVECTION

The internal flow configuration is the most convenient and popularly used geometry for heating or cooling of fluids in various thermal and chemical processes. There are basic differences in the development of boundary layer between the external flow geometry and internal flow geometry. In the case of internal flow, the fluid is confined by a surface, and the boundary layer after some distance cannot develop further. This region is called entrance region. The region beyond this point is known as fully developed region. Another important difference is that the flow does not change over at a location from laminar to turbulent conditions, but is laminar or turbulent from the start, depending upon the value of Reynolds number (based on diameter) being greater or less than about 2300.

## HYDRODYNAMIC BOUNDARY LAYER DEVELOPMENT

The development of hydrodynamic boundary layer in a pipe, together with velocity distributions at various sections for laminar and turbulent flows are shown in Fig. for the shape of the profile in laminar flow given by

$$
\frac{u_{r}}{u_{\max }}=1-\left(\frac{r}{R}\right)^{2}
$$

where $u_{\text {max }}$ is the velocity at the centreline.

$$
u_{\max }=2 u_{m}
$$

The velocity distribution beyond the entry region will remain invariant. But the actual distribution will be affected by the fluid property variation during heating or cooling. If heating or cooling causes reduction in the viscosity near the wall, the velocity profile flattens out as compared to isothermal flow. If viscosity increases, then the velocity near the wall will be reduced further and the velocity distribution will be more peaked. This is shown in Fig.Such distortion will affect the heat transfer correlations to some extent

## THERMAL BOUNDARY LAYER

The development of thermal boundary layer is somewhat similar to the development of velocity profile. As shown in fig.

i) As the temperature increases continuously the direct plot of temperature will vary with $x$ location. However the plot of dimensionless temperature ratio will provide a constant profile in the fully developed region. The bulk mean temperature $T_{m}$ varies along the length as heat is added/removed along the length. The ratio $\left(T_{w}-T_{r}\right) /\left(T_{w}-T_{m}\right)$ remains constant along the $x$ direction in the fully developed flow. $T_{r}$ is the temperature at radius $r$ and $T_{m}$ is the bulk mean temperature.
ii) The length of entry region will be different as compared to the velocity boundary development.
iii) Boundary conditions are also different-constant wall temperature and constant heat flux.
iv) The development of both boundary layers may be from entry or heating may start after the hydrodynamic boundary layer is fully developed.
These are in addition to the laminar and turbulent flow conditions. Thus it is not possible to arrive at a limited number of correlations for convection coefficient.

In the case of internal flow, there are four different regions of flow namely (i) Laminar entry region (ii) Laminar fully developed flow (iii) Turbulent entry region and (iv) Turbulent fully developed region.

## LAMINAR FLOW

Constant Wall Temperature: $\left(\operatorname{Re}_{d}<2300\right)$ Reynolds number is defined as below

$$
R e=D u m / v=4 G / \pi D \mu
$$

It is to be noted that for long tubes Nusselt number does not vary with length and is constant as given by equation

$$
\mathrm{Nu}=3.66
$$

## TURBULENT FLOW

The development of boundary layer is similar except that the entry region length is between $\mathbf{1 0}$ to $\mathbf{6 0}$ times the diameter. The convective heat transfer coefficient has a higher value as compared to laminar flow.
The friction factor for smooth pipes is given by eqn.

$$
\begin{aligned}
& f=0.184 R e^{-0.2} \\
& f=[0.7 \ln R e-1.64]^{-2} \\
& f=4[1.58 \ln R e-3.28]^{-2}
\end{aligned}
$$

The more popular correlation for fully developed flow in smooth tubes is due to Dittus and Boelter (1930) (modified Colburn)

$$
N u=0.023 \operatorname{Re} 0.8 P r^{n}
$$

$n=0.3$ for cooling and 0.4 for heating of fluids

## NATURAL CONVECTION

When a surface is maintained in still fluid at a temperature higher or lower than that of the fluid, a layer of fluid adjacent to the surface gets heated up or cooled. A density difference is created between this layer and the still fluid surrounding it. The density difference introduces a buoyant force causing flow of the fluid near the surface. Heat transfer under such conditions is known as natural or free convection. Usually a thin layer of flowing fluid forms over the surface. The fluid beyond this layer is essentially still, and is at a constant temperature of $\mathrm{T}_{\infty}$.

The flow velocities encountered in free convection is lower compared to flow velocities in forced convection. Consequently the value of convection coefficient is lower, generally by one order of magnitude. Hence for a given rate of heat transfer larger area will be required. As there is no need for additional devices to force the fluid, this mode is used for heat transfer in simple devices as well as for devices which have to be left unattended for long periods.

The heat transfer rate is calculated using the general convection equation given below

$$
\mathrm{Q}=\mathrm{h} \mathrm{~A}\left(\mathrm{~T}_{\mathrm{w}}-\mathrm{T}_{\infty}\right)
$$

Q -heat transfer in W, h -convection coefficient $-\mathrm{W} / \mathrm{m}^{2} \mathrm{~K}$.
A-area in $\mathrm{m}^{2}, \quad \mathrm{~T}_{\mathrm{w}}$-surface temperature
$\mathrm{T}_{\infty}$ —fluid temperature at distances well removed from the surface (here the stagnant fluid temperature)

## BASIC NATURE OF FLOW UNDER NATURAL CONVECTION CONDITIONS

The layer of fluid near the surface gets heated or cooled depending on the temperature of the solid surface. A density difference is created between the fluid near the surface and the stagnant fluid. This causes as in a chimney a flow over the surface. Similar to forced convection a thin boundary layer is thus formed over the surface. Inertial, viscous and buoyant forces are predominant in this layer. Temperature and velocity gradients exist only in this layer. The velocity and temperature distributions in the boundary layer near a hot vertical surface are shown in Fig

The velocity is zero at the surface and also at the edge of the boundary layer. As in the case of forced convection the temperature gradient at the surface is used in the determination of heat flow (heat is transferred at the surface by conduction mode).

$$
h=-\left.k \frac{\partial\left(\frac{T-T_{\infty}}{T_{w}-T_{\infty}}\right)}{\partial\left(\frac{y}{\delta}\right)}\right|_{y=0} .
$$

The temperature gradient at the surface can be evaluated using either the solution of differential equations or by assumed velocity and temperature profiles in the case of integral method of analysis. This leads to the identification of Nusselt number and Prand the number as in the case of forced convection. These numbers have the same physical significance as in forced convection.
The buoyant forces play an important role in this case, in addition to the viscous and inertia forces encountered in forced convection. This leads to the identification of a new dimensionless group called Grashof number

$$
G r=\frac{g \beta\left(T_{w}-T_{\infty}\right) \cdot L^{3}}{v^{2}}
$$

where $\beta$ is the coefficient of cubical expansion having a dimension of $1 /$ Temperature. For gases $\beta=1 / T$ where $T$ is in $K$. For liquids $\beta$ can be calculated if variation of density with temperature at constant pressure is known. The other symbols carry the usual meaning.

The physical significance of this number is given by

$$
\mathrm{Gr}=\frac{\text { Inertia force }}{\text { Viscous force }} \cdot \frac{\text { Buoyant force }}{\text { Viscous force }}
$$

The flow turns turbulent for value of $\operatorname{Gr} \operatorname{Pr}>10^{\circ}$. As in forced convection the microscopic nature of flow and convection correlations are distinctly different in the laminar and turbulent regions.

## CONSTANT HEAT FLUX CONDITION-VERTICAL SURFACES

Here the value of wall temperature is not known. So $\Delta T$ is unspecified for the calculation of Grashof number. Though a trial solution can be attempted, it is found easier to eliminate $\Delta T$ by $q$ which is known in most cases. This is done by multiplying Grashof number by Nusselt number and equating $q=h \Delta T$.
This product is known as modified Grashof number, Gr*

$$
G r_{x}^{*}=G r_{x} N u_{x}=\frac{g \beta \Delta t x^{3}}{v^{2}} \cdot \frac{h x}{k}=\frac{g \beta q x^{4}}{k v^{2}}
$$

The correlation for laminar range is given by

$$
\begin{gathered}
\mathrm{Nu}_{x}=0.60\left[\mathrm{Gr}_{x} * \mathrm{Pr}\right]^{0.2} \\
105<\mathrm{Gr}^{*}<10_{11}
\end{gathered}
$$

## Constant Heat Flux, Horizontal Surfaces

For horizontal surfaces, the correlations are given in table 10.1 for constant wall temperature conditions. For constant heat flux conditions the following correlations are available. The property values except $\beta$ in these cases are to be evaluated at $T_{\infty}$.
The characteristic length $L=$ Area/ perimeter generally. For circle $0.9 D$ and for Rectangle $(L+W) / 2$
For heated face facting upwards or cooled face facing downwards: laminar conditions

$$
\begin{aligned}
& N u=0.54(G r \operatorname{Pr})^{1 / 4}, \operatorname{Gr} \operatorname{Pr} \rightarrow 10^{5} \text { to } 2 \times 10^{7} \\
& \bar{N} u=0.14(G r \operatorname{Pr})^{1 / 3} \\
& \quad \text { Gr } \operatorname{Pr} \rightarrow 2 \times 10^{7} \text { to } 3 \times 10^{10} .
\end{aligned}
$$

For heated surface facing downward

$$
\begin{aligned}
& N u=0.27(G r P r)^{1 / 4} \\
G r P r \rightarrow & 3 \times 10^{5} \text { to } 3 \times 10^{10} \\
& N u=0.58(G r P r)^{0.2} \\
& 10^{6}<G r P r<10^{11}
\end{aligned}
$$

## HORIZONTAL CYLINDERS

A more general correlation as compared to the ones given in table for the laminar range, $\operatorname{Gr} \operatorname{Pr}<109$ the correlation is

$$
N u=0.36+\frac{0.518(G r P r)^{0.25}}{\left[1+(0.559 / P r)^{9 / 16}\right]^{4 / 9}}
$$

For spheres:
The general correlation is

$$
N u=2+0.43(\text { Gr Pr })^{0.25}
$$

$$
\begin{gathered}
\frac{T-T_{\infty}}{T_{o}-T_{\infty}}=e^{\left[\frac{-h}{c L_{c} \rho} \times \tau\right]} \\
\frac{368-288}{536-288}=e^{\left[\frac{58}{900 \times 0.0262 \times 2700} \times \tau\right]} \\
\tau=1355.4 \mathrm{sec}
\end{gathered}
$$

## Unit II

## May 2012

1. Air at $25^{\circ} \mathrm{C}$ flows past a flat plate at $2.5 \mathrm{~m} / \mathrm{s}$. the plate measures $\mathbf{6 0 0} \mathbf{~ m m ~ X ~} \mathbf{3 0 0} \mathbf{~ m m}$ and is maintained at a uniform temperature at $95{ }^{\circ} \mathrm{C}$. Calculate the heat loss from the plate, if the air flows parallel to the $\mathbf{6 0 0} \mathbf{~ m m}$ side. How would this heat loss be affected if the flow of air is made parallel to the $\mathbf{3 0 0} \mathbf{~ m m}$ side.

## Given:

Forced convection (air)
Flat plate

$$
\begin{aligned}
& \mathrm{T}_{\infty}=25^{\circ} \mathrm{C} \\
& \mathrm{U}=25 \mathrm{~m} / \mathrm{s} \\
& \mathrm{~T}_{\mathrm{w}}=95^{\circ} \mathrm{C} \\
& \mathrm{~L}=600 \mathrm{~mm}=600 \times 10^{-3} \mathrm{~m} \\
& \mathrm{~W}=300 \mathrm{~mm}=300 \times 10^{-3} \mathrm{~m}
\end{aligned}
$$

## Find

(i) Q if air flows parallel to 600 mm side
(ii) Q if air flows parallel to 300 mm side and $\%$ of heat loss.

## Solution:

$$
T_{f}=\frac{T_{w}-T_{\infty}}{2}=\frac{95-25}{2}=\frac{120}{2}=60^{\circ} \mathrm{C}
$$

Take properties of air at $\mathrm{T}_{\mathrm{f}}=60^{\circ} \mathrm{C}$ from H.M.T data book (page no 34)

$$
\begin{aligned}
& \operatorname{Pr}=0.696 \\
& \gamma=1897 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s} \\
& \mathrm{k}=0.02896 \\
& \operatorname{Re}=\frac{U L}{\gamma}=\frac{2.5 \times 0.6}{18.97 \times 10^{-6}} \\
& \operatorname{Re}=7.91 \times 10^{4}<5 \times 10^{5}
\end{aligned}
$$

This flow is laminar.
From H.M.T data book
(or)

$$
N u_{x}=0.332 R e_{x}{ }^{0.5} p r^{0.333}
$$

$$
N u_{L}=0.332 \operatorname{Re}_{L}{ }^{0.5} p r^{0.333}
$$

$$
\begin{aligned}
& =0.332 \mathrm{X}\left(7.91 \mathrm{X} 10^{4}\right)^{0.5}(0.696)^{0.333} \\
& \mathrm{Nu}_{\mathrm{L}}=82.76 \\
& \overline{N_{u}}=2 N u_{L}=2 \times 82.76 \\
& \overline{N_{u}}=165.52 \\
& \qquad \overline{N_{u}}=\frac{\bar{h} L}{k} \\
& \quad h(\text { or }) \bar{h}=\frac{\overline{N_{u}} k}{L}=\frac{165.52 \times 0.02896}{0.6} \\
& \quad h(\text { or }) \bar{h}=7.989 \mathrm{~W} / \mathrm{m}^{2} K \\
& Q=\bar{h} A(\Delta T)(\text { or }) h(\mathrm{w} . \mathrm{L})\left(T_{w}-T_{\infty}\right) \\
& Q_{1}=7.989(0.6 \times 0.3)(95-25) \\
& \mathrm{Q}_{1}=100.66 \mathrm{~W}
\end{aligned}
$$

(iii) If $\mathrm{L}=0.3 \mathrm{~m}$ and $\mathrm{W}=0.6 \mathrm{~m}$ (parallel to 300 mm side)

$$
\begin{gathered}
R_{e}=\frac{U L}{\gamma}=\frac{2.5 \times 0.3}{18.97 \times 10^{-6}}=3.95 \times 10^{4} \\
R_{e}=3.95 \times 10^{4}<5 \times 10^{5} \\
\text { the flow is laminar }
\end{gathered}
$$

From H.M.T Data book

$$
\begin{gathered}
N u_{x}=0.332 x^{0.5} \mathrm{Pr}^{0.333} \\
(\text { or }) N u_{L}=0.332 \operatorname{Re}_{L}^{0.5} \mathrm{Pr}^{0.333} \\
N u_{L}=0.332\left(3.95 \times 10^{4}\right)^{0.5}(0.696)^{0.333} \\
N u_{\mathrm{L}}=58.48 \\
\overline{N u}=2 N u_{L}=2 \times 58.48=116.96 \\
\overline{N_{u}}=\frac{\bar{h} L}{k} \\
\bar{h}=\frac{\overline{N_{u}} k}{L}=\frac{116.96 \times 0.02896}{0.3} \\
h(o r) \bar{h}=11.29 \mathrm{~W} / m^{2} K \\
Q_{2}=h A(\Delta T)(o r) h(w . L)\left(T_{w}-T_{\infty}\right) \\
Q_{2}=11.29(0.6 \times 0.3)(95-25) \\
\mathrm{Q}_{2}=142.25 \mathrm{~W}
\end{gathered}
$$

$\%$ heat loss $=\frac{\mathrm{Q}_{2}-\mathrm{Q}_{1}}{\mathrm{Q}_{1}} \times 100$

$$
=\frac{142.25-100.66}{100.66} \times 100
$$

$$
\% \text { heat loss }=41.32 \%
$$

2. When 0.6 kg of water per minute is passed through a tube of $\mathbf{2} \mathbf{~ c m ~ d i a m e t e r , ~ i t ~ i s ~}$ found to be heated from $20^{\circ} \mathrm{C}$ to $60^{\circ} \mathrm{C}$. the heating is achieved by condensing steam on the surface of the tube and subsequently the surface temperature of the tube is maintained at $90^{\circ} \mathrm{C}$. Determine the length of the tube required for fully developed flow. Given:

$$
\begin{array}{ll}
\text { Mass, } \mathrm{m}=0.6 \mathrm{~kg} / \mathrm{min} & =0.6 / 60 \mathrm{~kg} / \mathrm{s} \\
& =0.01 \mathrm{~kg} / \mathrm{s} \\
\text { Diameter, } \mathrm{D}=2 \mathrm{~cm} & =0.02 \mathrm{~m} \\
\text { Inlet temperature, } \mathrm{T}_{\mathrm{mi}} & =20^{\circ} \mathrm{C} \\
\text { Outlet temperature, } \mathrm{T}_{\mathrm{mo}} & =60^{\circ} \mathrm{C} \\
\text { Tube surface temperature, } \mathrm{T}_{\mathrm{w}}= & 90^{\circ} \mathrm{C}
\end{array}
$$

## To find

length of the tube,(L).

## Solution:

$$
\text { Bulk mean temperature }=T_{m}=\frac{T_{m i}+T_{m o}}{2}=\frac{20+60}{2}=40^{\circ} \mathrm{C}
$$

Properties of water at $40^{\circ} \mathrm{C}$ :
(From H.M.T Data book, page no 22, sixth edition)

$$
\begin{aligned}
& \mathrm{P}=995 \mathrm{~kg} / \mathrm{m}^{3} \\
& \mathrm{~V}=0.657 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s} \\
& \mathrm{Pr}=4.340 \\
& \mathrm{~K}=0.628 \mathrm{~W} / \mathrm{mK} \\
& \mathrm{C}_{\mathrm{p}}=4178 \mathrm{~J} / \mathrm{kgK}
\end{aligned}
$$

Mass flow rate, $\dot{m}=\rho A U$

$$
\begin{gathered}
U=\frac{\dot{\mathrm{m}}}{\rho \mathrm{~A}} \\
U=\frac{0.01}{995 \times \frac{\pi}{4}(0.02)^{2}} \\
\text { velocity, } U=0.031 \mathrm{~m} / \mathrm{s}
\end{gathered}
$$

Let us first determine the type of flow

$$
\begin{aligned}
R e=\frac{U D}{v} & =\frac{0.031 \times 0.02}{0.657 \times 10^{-6}} \\
R e & =943.6
\end{aligned}
$$

Since $\operatorname{Re}<2300$, the flow is laminar.
For laminar flow,
Nusselt Number, $\mathrm{Nu}=3.66$

We know that

$$
\begin{gathered}
N u=\frac{h D}{k} \\
3.66=\frac{h \times 0.02}{0.628} \\
h=114.9 \mathrm{~W} / \mathrm{m}^{2} K \\
\text { Heat transfer, } Q=m c_{p} \Delta T \\
Q=m c_{p}\left(T_{m o}-T_{m i}\right) \\
=0.01 \times 4178 \times(60-20) \\
\mathrm{Q}=1671.2 \mathrm{~W} \\
\text { We know that } Q=h A \Delta T \\
Q=h \times \pi \times D \times L \times\left(T_{w}-T_{m}\right) \\
\text { 1671.2 }=114.9 \times \pi \times 0.02 \times L \times(90-40) \\
\text { Length of tube }, \mathrm{L}=4.62 \mathrm{~m}
\end{gathered}
$$

## November 2012

3. Water is to be boiled at atmospheric pressure in a polished copper pan by means of an electric heater. The diameter of the pan is 0.38 m and is kept at $115^{\circ} \mathrm{C}$. calculate the following
4. Surface heat flux
5. Power required to boil the water
6. Rate of evaporation
7. Critical heat flux

## Given:

Diameter, $\mathrm{d}=0.38 \mathrm{~m}$
Surface temperature, $\mathrm{T}_{\mathrm{w}}=115^{\circ} \mathrm{C}$
To find
1.Q/A
2. P
3. $\dot{m}$
4. $(\mathrm{Q} / \mathrm{A})_{\text {max }}$

## Solution:

We know that, Saturation temperature of water is $100^{\circ} \mathrm{C}$
i.e. $\mathrm{T}_{\text {sat }}=100^{\circ} \mathrm{C}$

Properties of water at $100^{\circ} \mathrm{C}$ :
(From H.M.T Data book, page no 22, sixth edition)
Density, $\rho_{l}=961 \mathrm{~kg} / \mathrm{m}^{3}$
Kinematic viscosity, $\mathrm{v}=0.293 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$
Prandtl Number, $\operatorname{Pr}=1.740$
Specific heat, $\mathrm{C}_{\mathrm{pl}}=4216 \mathrm{~J} / \mathrm{kgK}$
Dynamic viscosity, $\mu_{l}=\rho_{l} \times v=961 \times 0.293 \times 10^{-6}$
$=281.57{\mathrm{X} 10^{-6} \mathrm{Ns} / \mathrm{m}^{2}}^{2}$
From Steam table
[R.S khurmi steam table]
At $100^{\circ} \mathrm{C}$
Enthalpy of evaporation, $\mathrm{h}_{\mathrm{fg}}=2256.9 \mathrm{~kJ} / \mathrm{kg}$.

$$
\mathrm{h}_{\mathrm{fg}}=2256.9 \times 10^{3} \mathrm{~J} / \mathrm{kg}
$$

Specific volume of vapour, $\mathrm{v}_{\mathrm{g}}=1.673 \mathrm{~m}^{3} / \mathrm{kg}$
Density of vapour, $\rho_{v}=\frac{1}{v_{g}}$

$$
\begin{gathered}
\rho_{v}=\frac{1}{1.673} \\
\rho_{v}=0.597 \mathrm{~kg} / \mathrm{m}^{3}
\end{gathered}
$$

$$
\Delta T=\text { excess temperature }=T_{w}-T_{\text {sat }}=115^{\circ}-100^{\circ}=15^{\circ} \mathrm{C}
$$

$$
\Delta T=15^{\circ} \mathrm{C}<50^{\circ} \mathrm{C} . \text { So this is Nucleate pool boiling process. }
$$

Power required to boil the water,
For Nucleate pool boiling
Heat flux, $\frac{Q}{A}=\mu_{l} \times h_{f g}\left[\frac{g \times\left(\rho_{l}-\rho_{v}\right)}{\sigma}\right]^{0.5} \times\left[\frac{C p l \times \Delta T}{C_{s f} \times h_{f g} P_{r}{ }^{n}}\right]^{3}$
(From H.M.T Data book)
Where $\sigma=$ surface tension for liquid vapour interface
At $100^{\circ} \mathrm{C}$
$\sigma=0.0588 \mathrm{~N} / \mathrm{m} \quad$ (From H.M.T Data book)
For water - copper $\rightarrow \mathrm{C}_{\mathrm{sf}}=$ surface fluid constant $=0.013$
$\mathrm{N}=1$ for water
(From H.M.T Data book)
Substitute
$\mu_{l}, h_{f g}, \rho_{l}, \rho_{v}, \sigma, C p l, \Delta T, C_{s f}, n, h_{f g}, p_{r}$ values in eqn (1)

$$
\begin{aligned}
\frac{Q}{A}=281.57 & \times 10^{-6} \times 2256.9 \times 10^{3 \times}\left[\frac{9.81 \times(961-0.597)}{0.0588}\right]^{0.5} \\
& \times\left[\frac{4216 \times 15}{0.013 \times 2256.9 \times 10^{3} \times(1.74)^{1}}\right]^{3}
\end{aligned}
$$

Surface Heat flux , $\frac{Q}{A}=4.83 \times 10^{5} \mathrm{~W} / \mathrm{m}^{2}$

$$
\begin{gathered}
\text { Heat transfer,, } Q=4.83 \times 10^{5} \times A \\
=4.83 \times 10^{5} \times \frac{\pi}{4} d^{2} \\
=4.83 \times 10^{5} \times \frac{\pi}{4}(0.38)^{2} \\
\mathrm{Q}=54.7 \mathrm{x} 10^{3} \mathrm{~W} \\
\mathrm{Q}=54.7 \mathrm{x} 10^{3}=\mathrm{P} \\
\text { Power }=54.7 \mathrm{x} 10^{3} \mathrm{~W}
\end{gathered}
$$

2. Rate of evaporation, ( $\dot{m}$ )

We know that,
Heat transferred, $Q=\dot{m} \times \mathrm{h}_{\mathrm{fg}}$

$$
\dot{m}=\frac{\mathrm{Q}}{\mathrm{~h}_{\mathrm{fg}}}=\frac{54.7 \times 10^{3}}{2256.9 \times 10^{3}}
$$

$$
\dot{m}=0.024 \mathrm{~kg} / \mathrm{s}
$$

3. Critical heat flux, $(\mathrm{Q} / \mathrm{A})$

For Nucleate pool boiling, critical heat flux,

$$
\frac{Q}{A}=0.18 h_{f g} \times \rho_{v}\left[\frac{\sigma \times g \times\left(\rho_{l}-\rho_{v}\right)}{\rho_{v}{ }^{2}}\right]^{0.25}
$$

(From H.M.T Data book)

$$
=0.18 \times 2256.9 \times 10^{3} \times 0.597 \times\left[\frac{0.0588 \times 9.81 \times(961-0.597)}{(0.597)^{2}}\right]^{0.25}
$$

$$
\text { Critical heat flux }, q=\frac{Q}{A}=1.52 \times 10^{6} \mathrm{~W} / \mathrm{m}^{2}
$$

## May 2013

4. A thin 80 cm long and 8 cm wide horizontal plate is maintained at a temperature of $130^{\circ} \mathrm{C}$ in large tank full of water at $70^{\boldsymbol{0}} \mathrm{C}$. Estimate the rate of heat input into the plate necessary to maintain the temperature of $130^{\circ} \mathrm{C}$.

## Given:

Horizontal plate length, $\mathrm{L}=80 \mathrm{~cm}=0.08 \mathrm{~m}$
Wide, $\mathrm{W}=8 \mathrm{~cm}=0.08 \mathrm{~m}$,
Plate temperature, $\mathrm{T}_{\mathrm{w}}=130^{\circ} \mathrm{C}$
Fluid temperature, $\mathrm{T}_{\infty}=70^{\circ} \mathrm{C}$
To find:

Rate of heat input into the plate, Q .
Solution:

Flim temperature, $\quad T_{f}=\frac{T_{w}-T_{\infty}}{2}=\frac{130+70}{2}=100^{\circ} \mathrm{C}$
Properties of water at $100^{\circ} \mathrm{C}$ :
(From H.M.T Data book, page no 22, sixth edition)

$$
\begin{gathered}
\rho=961 \mathrm{~kg} / \mathrm{m}^{3} \\
v=0.293 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s} \\
\operatorname{Pr}=1.740 \\
\mathrm{k}=0.6804 \mathrm{~W} / \mathrm{mK} \\
\beta_{\text {water }}=0.76 \times 10^{-3} \mathrm{~K}^{-1}
\end{gathered}
$$

(From H.M.T Data book, page no 30, sixth edition)
We know that,

$$
\text { Grashof number, } G r=\frac{g \times \beta \times L_{c}{ }^{3} \times \Delta T}{V^{2}}
$$

For horizontal plate:

$$
\begin{gathered}
\mathrm{L}_{\mathrm{c}}=\text { Characteristic length }=\frac{W}{2} \\
\mathrm{~L}_{\mathrm{c}}=\frac{0.08}{2} \\
\mathrm{~L}_{\mathrm{c}}=0.04 \mathrm{~m} \\
\text { Grashof number }, G r=\frac{9.81 \times 0.76 \times 10^{-3} \times(0.04)^{3} \times(130-70)}{\left(0.293 \times 10^{-6}\right)^{2}} \\
G r=0.333 \times 10^{9} \\
G r P r=0.333 \times 10^{9} \times 1.740 \\
G r P r=0.580 \times 10^{9}
\end{gathered}
$$

GrPr value is in between $8 \times 10^{6}$ and $10^{11}$
i.e., $8 \times 10^{6}<\operatorname{GrPr}<10^{11} \mathrm{So}$, for horizontal plate, upper surface heated,

Nusselt number, $\mathrm{Nu}=0.15(\mathrm{GrPr})^{0.333}$
(From H.M.T Data book, page no 136, sixth edition)

$$
\begin{aligned}
& \mathrm{Nu}=0.15\left(0580 \times 10^{9}\right)^{0.333} \\
& \mathrm{Nu}=124.25
\end{aligned}
$$

$$
\text { Nusselt number, } \mathrm{Nu}=\frac{\mathrm{h}_{\mathrm{u}} \mathrm{~L}_{\mathrm{c}}}{\mathrm{k}}
$$

$$
124.25=\frac{\mathrm{h}_{\mathrm{u}} \times 0.04}{0.6804}
$$

$$
\mathrm{h}_{\mathrm{u}}=2113.49 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
$$

Heat transfer coefficient for upper surface heated $h_{u}=2113.49 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$
For horizontal plate, Lower surface heated:

$$
\text { Nusselt number, } \mathrm{Nu}_{1}=0.27(\mathrm{GrPr})^{0.25}
$$

(From H.M.T Data book, page no 137, sixth edition)

$$
\begin{aligned}
& =0.27\left[0.580 \times 10^{9}\right]^{0.25} \\
& \mathrm{Nu}_{1}=42.06
\end{aligned}
$$

We know that,

$$
\begin{gathered}
\text { Nusselt number, } \mathrm{Nu}_{1}=\frac{\mathrm{h}_{1} \mathrm{~L}_{\mathrm{c}}}{\mathrm{k}} \\
42.06=\frac{\mathrm{h}_{1} \times 0.04}{0.6804} \\
\mathrm{~h}_{1}=715.44 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
\end{gathered}
$$

Heat transfer coefficient for lower surface heated $h_{1}=715.44 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$

$$
\begin{aligned}
& \text { Total heat transfer, } \mathrm{Q}=\left(\mathrm{h}_{\mathrm{u}}+\mathrm{h}_{1}\right) \mathrm{A} \Delta \mathrm{~T} \\
& \qquad=\left(\mathrm{h}_{\mathrm{u}}+\mathrm{h}_{1}\right) \times \mathrm{W} \times \mathrm{L} \times\left[\mathrm{T}_{\mathrm{w}}-\mathrm{T}_{\infty}\right] \\
& =(2113.49+715.44) \times(0.08 \times 0.8) \times[130-70] \\
& \mathrm{Q}=10.86 \times 10^{3} \mathrm{~W}
\end{aligned}
$$

5. A vertical pipe 80 mm diameter and 2 m height is maintained at a constant temperature of $120^{\circ} \mathrm{C}$. the pipe is surrounded by still atmospheric air at $30^{\circ}$. Find heat loss by natural convection.

## Given:

Vertical pipe diameter $\mathrm{D}=80 \mathrm{~mm}=0.080 \mathrm{~m}$
Height (or) length $L=2 \mathrm{~m}$
Surface temperature $\mathrm{T}_{\mathrm{S}}=120^{\circ} \mathrm{C}$
Air temperature $\mathrm{T}_{\infty}=30^{\circ} \mathrm{C}$

## To find

heat loss (Q)
Solution:
We know that
Flim temperature ,

$$
T_{f}=\frac{T_{w}+T_{\infty}}{2}=\frac{120+30}{2}=75^{\circ} \mathrm{C}
$$

Properties of water at $75^{\circ} \mathrm{C}$ :

$$
\begin{aligned}
& \rho=1.0145 \mathrm{~kg} / \mathrm{m}^{3} \\
& v=20.55 \mathrm{x} 10^{-6} \mathrm{~m}^{2} / \mathrm{s} \\
& \operatorname{Pr}=0.693 \\
& \mathrm{k}=30.06 \times 10^{-3} \mathrm{~W} / \mathrm{mK}
\end{aligned}
$$

We know

$$
\beta=\frac{1}{T_{f} \operatorname{in} K}
$$

$$
\beta=\frac{1}{75+273}=2.87 \times 10^{-3} K^{-1}
$$

We know

$$
\begin{gathered}
\text { Grashof number, } G r=\frac{g \times \beta \times L^{3} \times \Delta T}{V^{2}} \\
=\frac{9.81 \times 2.87 \times 10^{-3} \times(0.08)^{3} \times(120-30)}{\left(20.55 \times 10^{-6}\right)^{2}} \\
G r=4.80 \times 10^{10} \\
\operatorname{GrPr}=4.80 \times 10^{10} \times 0.693 \\
\operatorname{GrPr}=3.32 \times 10^{10}
\end{gathered}
$$

Since $\operatorname{GrPr}>10^{9}$, flow is turbulent.
For turbulent flow, from HMT data book

$$
\begin{gathered}
N u=0.10(G r P r)^{0.333} \\
N u=0.10\left(3.32 \times 10^{10}\right)^{0.333} \\
\mathrm{Nu}=318.8
\end{gathered}
$$

We know that,

$$
\text { Nusselt number, } N u=\frac{h L}{k}
$$

$$
318.8=\frac{h \times 2}{30.06 \times 10^{-3}}
$$

Heat transfer cofficient, $h=4.79 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$
Heat loss, $Q=h \times A \times \Delta T$

$$
\begin{aligned}
& =h \times \pi \times D \times L \times\left(T_{s}-T_{\infty}\right) \\
& \quad=4.79 \times \pi \times 0.080 \times 2 \times(120-30) \\
& \mathrm{Q}=216.7 \mathrm{~W}
\end{aligned}
$$

Heat loss $\mathrm{Q}=216.7$.

## November 2012

6. Derive an equation for free convection by use of dimensional analysis.

$$
N u=C\left(P r^{n} \cdot G r^{m}\right)
$$

Assume, $\mathrm{h}=\mathrm{f}\{\rho, \mu, \mathrm{Cp}, \mathrm{k}, \Sigma,(\beta, \Delta \mathrm{T})\}$
The heat transfer co efficient in case of natural or free convection, depends upon the variables, $\mathrm{V}, \rho, \mathrm{k}, \mu, \mathrm{Cp}$ and L , or D . Since the fluid circulation in free convection is owing to difference in density between the various fluids layers due to temperature gradient and not by external agency.
Thus heat transfer coefficient ' $h$ ' may be expressed as follows:
$h=f\left(\rho, \mathrm{~L}, \mu, \mathrm{c}_{\mathrm{p}}, \mathrm{k}, \beta \mathrm{g} \Delta \mathrm{T}\right)$
$f_{1}\left(\rho, L, \mu, k, h, c_{p}, \beta g \Delta T\right)$
[This parameter $(\beta \mathrm{g} \Delta \mathrm{T})$ represents the buoyant force and has the dimensions of $\mathrm{LT}^{-2}$.]
Total number of variables, $\mathrm{n}=7$
Fundamental dimensions in the problem are M,L,T, $\theta$ and hense $\mathrm{m}=4$
Number of dimensionless $\pi$ - terms $=(n-m)=7-4=3$
The equation (ii) may be written as

$$
f_{1}\left(\pi_{1}, \pi_{2}, \pi_{3}\right)=3
$$

We close $\rho, \mathrm{L}, \mu$ and k as the core group (repeating variables) with unknown exponents. The groups to be formed are now represented as the following $\pi$ groups.

$$
\begin{gathered}
\pi_{1}=\rho^{a_{1}} \cdot L^{b_{1}} \cdot \mu^{c_{1}} \cdot k^{d_{1}} \cdot h \\
\pi_{2}=\rho^{a_{2}} \cdot L^{b_{2}} \cdot \mu^{c_{2}} \cdot k^{d_{2}} \cdot c_{p} \\
\pi_{3}=\rho^{a_{3}} \cdot L^{b_{3}} \cdot \mu^{c_{3}} \cdot k^{d_{3}} \cdot \beta g \Delta t
\end{gathered}
$$

$\pi_{1}$ - term:

$$
M^{0} L^{0} T^{0} \theta^{O}=\left(M L^{-3}\right)^{a_{1}} \cdot(L)^{b_{1}} \cdot\left(M L^{-1} T^{-1}\right)^{c_{1}} \cdot\left(M L T^{-3} \theta^{-1}\right)^{d_{1}} \cdot\left(M L^{-3} \theta^{-1}\right)
$$

Equating the exponents of $\mathrm{M}, \mathrm{L}, \mathrm{T}$ and $\theta$ respectively, we get
For M: $0=\mathrm{a}_{1}+\mathrm{c}_{1}+\mathrm{d}_{1}+1$
For L: $0=-3 a_{1}+b_{1}-c_{1}+d_{1}$
For T: $0=-c_{1}+3 d_{1}-3$
For T: $\theta=-d_{1}-1$
Solving the above equations, we get

$$
\begin{aligned}
\mathrm{a}_{1}=0, \mathrm{~b}_{1}=1, \mathrm{c}_{1}=0, \mathrm{~d}_{1}= & -1 \\
& \pi_{1}=L k^{-1} h(\text { or }) \pi_{1=} \frac{h L}{k}
\end{aligned}
$$

$\pi_{2}$ - Term:

$$
M^{0} L^{0} T^{0} \theta^{O}=\left(M L^{-3}\right)^{a_{2}} \cdot(L)^{b_{2}} \cdot\left(M L^{-1} T^{-1}\right)^{c_{2}} \cdot\left(M L T^{-3} \theta^{-1}\right)^{d_{2}} \cdot\left(L^{2} T^{-2} \theta^{-1}\right)
$$

Equating the exponents of $\mathrm{M}, \mathrm{L}, \mathrm{T}$ and $\theta$ respectively, we get
For M: $0=a_{2}+c_{2}+d_{2}$
For L: $0=-3 a_{2}+b_{2}-c_{2}+d_{2}+2$
For T: $0=-c_{2}-3 d_{2}-2$
For T: $\theta=-\mathrm{d}_{2}-1$
Solving the above equations, we get

$$
\begin{aligned}
\mathrm{a}_{2}=0, \mathrm{~b}_{2}=0, \mathrm{c}_{2}=1, \mathrm{~d}_{2} & =-1 \\
\pi_{2} & =\mu \cdot k^{-1} \cdot c_{p}(\text { or }) \pi_{2}=\frac{\mu c_{p}}{k}
\end{aligned}
$$

## $\pi_{3}$ - Term:

$$
M^{O} L^{0} T^{0} \theta^{O}=\left(M L^{-3}\right)^{a_{3}} \cdot(L)^{b_{3}} \cdot\left(M L^{-1} T^{-1}\right)^{c_{3}} \cdot\left(M L T^{-3} \theta^{-1}\right)^{d_{3}} \cdot\left(L T^{-2}\right)
$$

Equating the exponents of $\mathrm{M}, \mathrm{L}, \mathrm{T}$ and $\theta$ respectively, we get
For M: $\quad 0=a_{3}+c_{3}+d_{32}$
For L: $\quad 0=-3 \mathrm{a}_{3}+\mathrm{b}_{3}-\mathrm{c}_{3}+\mathrm{d}_{3}+1$
For T: $\quad 0=-\mathrm{c}_{3}-3 \mathrm{~d}_{3}-2$
For T: $\quad \theta=-d_{3}$
Solving the above equations, we get
$\mathrm{a}_{3}=2, \mathrm{~b}_{3}=3, \mathrm{c}_{3}=-2, \mathrm{~d}_{3}=0$

$$
\pi_{3}=\rho^{2} \cdot L^{3} \mu^{-2} \cdot(\beta g \Delta t)
$$

or $\quad \pi_{3}=\frac{(\beta g \Delta t) \rho^{2} \cdot L^{3}}{\mu^{2}}=\frac{(\beta g \Delta t) L^{3}}{v^{2}}$
or $\quad N u=\emptyset(\operatorname{Pr})(G r)$
or $\quad N u=C(\operatorname{Pr})^{n}(G r)^{m}($ where $G r=$ Grashoff number $)$
Here $C, n$ and $m$ are constants and may be evaluated experimentally.

## Unit $=3$ B BbAff Ghfangidefsationd

## Boiling

Boiling is a convection process involving a change in phase from liquid to vapour. Boiling may occur when a liquid is in contact with a surface maintained at a temperature higher than the saturation temperature of the liquid

Heat is transferred from the solid surface to the liquid according to the law

$$
\mathrm{q}=\mathrm{h}\left(\mathrm{~T}_{\mathrm{s}}-\mathrm{T}_{\mathrm{sat}}\right) \quad=\mathrm{h} \Delta \mathrm{~T}_{\mathrm{e}}
$$

$\Delta T_{e}=\left(T_{s}-T_{\text {sat }}\right)$ is known as the excess temperature

## Application:-

Boiling process finds wide application as mentioned below
i) steam production (steam and nuclear power plant )
ii) Heat absorption in refrigeration an air conditioning system.
iii) Distillation, and refining of liquids
iv) Concentration, dehydration and drying of foods and materials.
v) Cooling of nuclear reactors and rocket motors.

The boiling heat transfer phenomenon may occur in the following forms:-
i) Pool boiling :-

In the case the liquid above the hot surface is essentially stagnant and its motion near the surface is due to free convection and mixing induced by bubble growth and detachment.

The pool boiling occurs in steam boilers involving natural convection.
(values are for water boiling at $100^{\circ} \mathrm{C}$ )

1. Purely convective region $\Delta T<5^{\circ} \mathrm{C}$
2. Nucleate Boiling $5<\Delta T<50^{\circ} \mathrm{C}$
3. Unstable (nucleate $\Leftrightarrow$ film) boiling $50^{\circ} \mathrm{C}<\Delta T<200^{\circ} \mathrm{C}$
4. Stable film boiling $\Delta T>200^{\circ} \mathrm{C}$.

Note that the temperature values are indicative only.

Boiling regimes:-

Pool boiling process has following six regimes
i) interface evaporation (free convection) - Region I
ii) Nucleate boiling - Region II \& III
iii) Film boiling - Region IV,V\&VI

The different regimes of boiling are indicated in figure. This specific curve has been obtained from an electrically heated platinum wire submerged and measuring the surface heat flux ( $\mathrm{q}_{\mathrm{s}}$ ).

## (i) Interface evaporation (Free convection) Region I

Region I called the free convection zone, the excess temperature $\Delta T_{e}$ is very small ( $\cong 50 \mathrm{C}$ ). here the liquid near the surface is superheated and evaporation takes place at the liquid surface.
(ii) Nucleate boiling - Region II \& III

As the excess temperature is further increased bubbles are formed more rapidly and rise to the surface of the liquid resulting in rapid evaporation. Nucleate boiling exists up to $\Delta \mathrm{T}_{\mathrm{e}}=50{ }^{\circ} \mathrm{C}$. at the end
of the nucleate boiling the heat flux is maximum. This heat flux, known as the critical heat flux (or ) Burnout point.
(iii) Film boiling
Region -IV

Further increase of heat flux with increase in excess temperature up to region III. After region III heat flux decrease.This region the bubbles formation is very rapid, and the bubbles collapses and form a vapour film which covers the surface completely. With in the temperature range $50{ }^{\circ} \mathrm{C}<\Delta \mathrm{T}_{\mathrm{e}}<$ $150{ }^{\circ} \mathrm{C}$, condition oscillate between nucleate and film boiling this region is called unstable film boiling.

## Region - V

With further increase in $\Delta \mathrm{T}_{\mathrm{e}}$ the vapour film is stabilized and the heating surface is completely covered by a vapour blanket and the heat flux is the lowest as shown in region V

## Region - VI

This region heat flux slowly increases with the increase in excess temperature. The surface temperature required to maintained a stable film are high and under these conditions a sizeable amount of heat is lost by the surface due to radiation.

Flow boiling:-

Flow or forced convection boiling may occur when a liquid is forced through a pipe or over a surface which is maintained at a temperature higher than the saturation temperature of the liquid

## Application :-

Design of steam generators for nuclear power plants and space power plants.

## Boiling correlations:-

Nucleate pool boiling:-

## Critical heat flux :-

$$
\frac{Q}{A}=0.18 h_{f g} \rho_{v}\left(\frac{\sigma g\left(\rho_{l}-\rho_{v}\right)}{\rho v^{2}}\right)^{1 / 4}
$$

$$
\Delta T \quad=\left(\mathrm{T}_{\mathrm{s}}-\mathrm{T}_{\text {sat) }}\right)<50 \stackrel{\circ}{\circ} \text { for nucleate pool boiling }
$$

## Film pool boiling

$$
\begin{aligned}
\Delta T & =\left(\mathrm{T}_{\mathrm{s}}-\mathrm{T}_{\text {sat }}\right)>50 \stackrel{\circ}{ } \text { C for film boiling } \\
\mathrm{h} & =\mathrm{h}_{\mathrm{conv}}+0.75 \mathrm{~h}_{\mathrm{rad}}
\end{aligned}
$$

$$
\begin{aligned}
& \text { Heat flux } \mathrm{q}_{\mathrm{s}}=\frac{Q}{A}=\mu_{l} h_{f g}\left(\frac{g\left(\rho_{l}-\rho_{v}\right)}{\sigma}\right)^{1 / 2}\left(\frac{C_{p l} \Delta T}{C_{s f} h_{f g} P_{r}^{1.7}}\right)^{3} \\
& \mu_{l} \quad=\text { Liquid viscosity (Dynamic) } \mathrm{Ns} / \mathrm{m}^{2} \\

& \rho_{l} \quad=\text { Density of saturated liquid }\left(\mathrm{kg} / \mathrm{m}^{3}\right) \\
& \rho_{v} \quad=\text { Density of saturated vapour }\left(\mathrm{kg} / \mathrm{m}^{3}\right) \\
& \sigma \quad=\text { surface tension of the liquid vapour interface ( } \mathrm{N} / \mathrm{m} \text { ) } \\
& C_{p l} \quad=\text { Specific heat capacity at constant pressure } \\
& \text { Csf = Surface fluid constant } \\
& \Delta T=\left(\mathrm{T}_{\mathrm{s}}-\mathrm{T}_{\mathrm{sat}}\right) \\
& \mathrm{T}_{\mathrm{s}} \quad=\text { surface temperature }{ }^{\circ} \mathrm{C} \\
& \mathrm{~T}_{\text {sat }} \quad=\text { saturation temperature } \\
& \text { g } \quad=\text { acceleration due to gravity (9.81) }
\end{aligned}
$$

$$
\mathrm{h}_{\mathrm{conv}}=0.62\left(\frac{K_{v}^{3} \rho_{v}\left(\rho_{l}-\rho_{v}\right) g\left(h_{f g}+0.4 C_{p_{v}} \Delta T\right)}{\mu_{v} D \Delta T}\right)^{1 / 4}
$$

where,
$K_{V} \quad=$ Thermal conductivity of vapour $\mathrm{W} / \mathrm{mK}$
$\mathrm{h}_{\mathrm{fg}} \quad=$ Enthalpy of vaporization ( $\mathrm{J} / \mathrm{kg}$ )
$\rho_{l} \quad=$ Density of saturated liquid $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$
$\rho_{v} \quad=$ Density of saturated vapour $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$
$\mu_{v} \quad=$ Dynamic viscosity of vapour $\mathrm{Ns} / \mathrm{m}^{2}$
$\mathrm{C}_{\mathrm{pv}} \quad=$ Specific heat of vapour at constant pressure (kJ/kgK)

D = Diameter , m
$\Delta T=\left(\mathrm{T}_{\mathrm{s}}-\mathrm{T}_{\text {sat }}\right)$
$\mathrm{T}_{\mathrm{s}} \quad=$ surface temperature ${ }^{\circ} \mathrm{C}$
$\mathrm{T}_{\text {sat }} \quad=$ saturation temperature
g $\quad=$ acceleration due to gravity (9.81)

$$
\mathrm{h}_{\mathrm{rad}}=\sigma \varepsilon\left(\frac{T_{s}^{4}-T_{s a t}^{4}}{T_{s}-T_{s a t}}\right)
$$

Where,

$$
\begin{aligned}
& \sigma=\text { Stefan boltzmann constant }=5.67 \times 10^{-8} \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} 4 \\
& \varepsilon=\text { Emissivity }
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{s}}=\text { surface temperature }{ }^{\circ} \mathrm{C} \\
& \mathrm{~T}_{\text {sat }}=\text { saturation temperature }
\end{aligned}
$$

## Condensation heat transfer:-

The condensation process is the reverse of boiling process. Whenever a saturation vapour comes in contact with a surface whose temperature is lower than the saturation temperature corresponding to the vapour pressure

The change of phase from vapour to liquid state is known as condensation.

## Types of condensation

There are two types of condensation
i) Film wise condensation
ii) Drop wise condensation

## Film wise condensation:-

In which the condensate wets the surface forming a continuous film which covers the entire surface.

Drop wise condensation:-

In which the vapour condenses into small liquid droplets of vapours sizes which fall down the surface in a random fashion.

Nusselt's analysis of film condensation :-
i) the plate is maintained at a uniform temperature ( $T_{s}$ ), which is less than the saturation temperature ( $\mathrm{T}_{\text {sat }}$ ) of the vapour
ii) the condensate flow is laminar
iii) the fluid properties are constant
iv) the shear stress at the liqid vapour interface is negligible.
v) The acceleration of fluid with in the condensate layer is negligible
vi) The heat transfer across the condensate layer is by pure conduction and the temperature distribution is linear

Correlation for film wise condensing process:-
i) Film thickness for laminar flow vertical surface

```
                \deltax=(\frac{4\mp@subsup{\mu}{l}{}\mp@subsup{K}{l}{}x(\mp@subsup{T}{\mathrm{ sat }}{}-\mp@subsup{T}{s}{})}{g\mp@subsup{h}{fg}{}\mp@subsup{\rho}{l}{2}}\mp@subsup{)}{}{1/4}
    \deltax = Boundary layer thickness (m)
    Kl = Thermal conductivity of fluid (W/mK)
    h}\mp@subsup{\textrm{fg}}{\textrm{fg}}{}\quad=\mathrm{ Enthalpy of vaporization (J/kg)
    \rhol}\quad=\mathrm{ Density of fluid (kg/m}\mp@subsup{}{}{3}
    \mu
    Cpv = Specific heat of vapour at constant pressure (kJ/kgK)
    x = Distance along the surface,(m)
    Ts = surface temperature O OC
    T
    g = acceleration due to gravity (9.81)
```

ii) Local heat transfer co-efficient ( $h_{x}$ ) for vertical surface ,laminar flow

$$
\mathrm{h}_{\mathrm{x}}=\frac{K}{\delta x}
$$

iii) Average heat transfer coefficient (h) for vertical surface, laminar flow

$$
\mathrm{h}_{\mathrm{L}}=0.943\left(\frac{K^{3} \rho_{l}\left(\rho_{l}-\rho_{v}\right) g h_{f g}}{\mu L\left(T_{\text {sat }}-T_{s}\right)}\right)^{1 / 4}
$$

Since the experimental values of $h_{L}$ are usually $20 \%$ (or) higher than those predicted by $h_{L}$, it has been suggested by Mc Adams that the constant 0.943 be replaced by 1.13 hence

$$
\mathrm{h}_{\mathrm{L}}=1.13\left(\frac{K_{l}^{3} \rho_{l}\left(\rho_{l}-\rho_{v}\right) g h_{f g}}{\mu_{l} L\left(T_{\text {sat }}-T_{s}\right)}\right)^{1 / 4}
$$

iv) Film temperature $\mathrm{T}_{\mathrm{f}}=\frac{\left(T_{s a t}+T_{s}\right)}{2}$

$$
\mathrm{h}_{\mathrm{fg}} \text { should be taken at } \mathrm{T}_{\text {sat }}
$$

v) Film wise condensation on horizontal tubes:-

$$
h_{D} \quad=0.725\left(\frac{K_{l}^{3} \rho_{l}\left(\rho_{l}-\rho_{v}\right) g h_{f g}}{\mu_{l} D\left(T_{s a t}-T_{s}\right)}\right)^{1 / 4}
$$

vi) Average heat transfer coefficient for the bank of tubes :-

$$
\mathrm{h}_{\mathrm{D}} \quad=0.725\left(\frac{K_{l}^{3} \rho_{l}\left(\rho_{l}-\rho_{v}\right) g h_{f g}}{N \mu_{l} D\left(T_{\text {sat }}-T_{s}\right)}\right)^{1 / 4}
$$

vii) For laminar flow $\mathrm{R}_{\mathrm{e}}<1800$
viii) For turbulent flow $R_{e}>1800$
ix) $\mathrm{R}_{\mathrm{e}}=\frac{4 \dot{m}}{\mu P}$
x) Average heat transfer coefficient for vertical surface , turbulent flow

$$
\mathrm{h}=0.0077\left(\mathrm{R}_{\mathrm{e}}\right)^{0.4}\left(\frac{K_{l}^{3} \rho_{l}^{2} g}{\mu_{l}^{2}}\right)^{0.333}
$$

Solved problems on Boiling:-

1. Water is boiled at the rate of $25 \mathrm{~kg} / \mathrm{hr}$ in a polished copper pan, 280 mm in diameter at atmospheric pressure. Assuming nucleate boiling condition, calculate the temperature of the bottom surface of the pan

## Given data:

$$
\begin{aligned}
& \dot{m}=25 \mathrm{~kg} / \mathrm{hr} \quad=25 / 3600 \\
& \dot{m}=6.6 \times 10^{-3} \mathrm{~kg} / \mathrm{hr} \\
& \mathrm{~d}=300 \mathrm{~mm}=0.3 \mathrm{~m}
\end{aligned}
$$

To find :-

## Surface temperature $\left(T_{s}\right)$

Solution:-

We know saturation temperature $\left(T_{s}\right)$

$$
\mathrm{T}_{\text {sat }}=100{ }^{\circ} \mathrm{C}
$$

## Saturated water Properties at $100{ }^{\circ} \mathrm{C}$

[ From HMT data book Page No: $21-6^{\text {th }}$ edition ]
$v=0.293 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$
$\rho_{l}=961 \mathrm{~kg} / \mathrm{m}^{3}$

$$
\begin{aligned}
\mathrm{C}_{\mathrm{pl}} & =4216 \mathrm{~J} / \mathrm{kg} \\
\mathrm{Pr}_{\mathrm{r}} & =1.74 \\

\mu_{l} & =281.57 \times 10^{-6} \mathrm{Ns} / \mathrm{m}^{2}
\end{aligned}
$$

From steam table, Fro $100{ }^{\circ} \mathrm{C}$

$$
\begin{aligned}
& \mathrm{h}_{\mathrm{fg}}=2256.9 \mathrm{~kJ} / \mathrm{kg} \\
& \mathrm{v}_{\mathrm{g}}=1.673 \mathrm{~m}^{3} / \mathrm{kg}
\end{aligned}
$$

$$
\rho_{v}=\frac{1}{v_{g}}
$$

$$
\rho_{v}=0.597 \mathrm{~kg} / \mathrm{m}^{3}
$$

At $100{ }^{\circ} \mathrm{C}$
$\sigma=0.0588 \mathrm{~N} / \mathrm{m}$
(From HMT data book page no 144)
$C_{s f}=0.013$
(From HMT data book page no 145)

$$
\mathrm{Q}=\mathrm{m} \times \mathrm{h}_{\mathrm{fg}}
$$

$$
\frac{Q}{A}=\frac{\mathrm{mx} \mathrm{~h}_{\mathrm{fg}}}{A}
$$

$$
\frac{Q}{A}=\frac{\mathrm{mxh}_{\mathrm{tg}}}{\frac{\pi}{4} d^{2}}
$$

$$
\frac{Q}{A}=\frac{6.6 \times 10-3 \times 2257 \times 10^{3}}{\frac{\pi}{4}(.28)^{2}}
$$

$$
\frac{Q}{A}=254.52 \times 10^{3}
$$

Heat flux $\mathrm{q}_{\mathrm{s}}=\frac{Q}{A}=\mu_{l} h_{f g}\left(\frac{g\left(\rho_{l}-\rho_{v}\right)}{\sigma}\right)^{1 / 2}\left(\frac{C_{p l} \Delta T}{C_{s f} h_{f g} P_{r}^{1.7}}\right)^{3}$
$254.52 \times 10^{3}=$
$281.57 \times 10^{-6} \times 2257 \times 10^{3}\left(\frac{9.81(961-0.597)}{0.0588}\right)^{1 / 2}\left(\frac{4216 \Delta T}{0.013 \times 2257 \times 10^{3} \times 1.74}\right)^{3}$

```
254.52\times1\mp@subsup{0}{}{3}=44.7678\times\DeltaT
```

$$
\begin{aligned}
& \Delta T=12.08 \circ \mathrm{C} \\
& \Delta T=\left(\mathrm{T}_{\mathrm{s}}-\mathrm{T}_{\text {sat }}=12.08\right. \\
& \mathrm{T}_{\mathrm{s}}=12.08+\mathrm{T}_{\text {sat }} \\
& \mathrm{T}_{\mathrm{s}}=12.08+100 \\
& \mathrm{~T}_{\mathrm{s}}=112.08 \circ \mathrm{C}
\end{aligned}
$$

Result :

$$
\text { Surface temperature }\left(\mathrm{T}_{\mathrm{s}}\right)=112.08 \varrho^{\circ} \mathrm{C}
$$

2. water at atmospheric pressure is to be boiled in polished copper pan. The diameter of the pan is 350 mm .and is kept at $115{ }^{\circ} \mathrm{C}$ calculate the following.
i) power of the burner
ii) Rate of evaporation in $\mathrm{kg} / \mathrm{hr}$
iii) Critical heat flow for this condition.

Given data:

D $=350 \mathrm{~mm}=0.35 \mathrm{~m}$
$\mathrm{T}_{\mathrm{s}}=115{ }^{\circ} \mathrm{C}$

To find :-
i) power of the burner
ii) Rate of evaporation in $\mathrm{kg} / \mathrm{hr}$
iii) Critical heat flow for this condition.

## Solution:-

We know saturation temperature $\left(T_{s}\right)$

$$
\mathrm{T}_{\text {sat }}=100 \stackrel{\circ}{\mathrm{o}} \mathrm{C}
$$

At $100^{\circ} \mathrm{C}$
$\sigma=0.0588 \mathrm{~N} / \mathrm{m}$
(From HMT data book page no 144)
$C_{\text {sf }}=0.013$
(From HMT data book page no 145)

1) Power required:

Heat flux $\mathrm{q}_{\mathrm{s}}=\frac{Q}{A}=\mu_{l} h_{f g}\left(\frac{g\left(\rho_{l}-\rho_{v}\right)}{\sigma}\right)^{1 / 2}\left(\frac{C_{p l} \Delta T}{C_{s f} h_{f g} P_{r}^{1.7}}\right)^{3}$
$\frac{Q}{A}=$
$281.57 \times 10^{-6} \times 2257 \times 10^{3}\left(\frac{9.81(961-0.597)}{0.0588}\right)^{1 / 2}\left(\frac{4216 \times 15}{0.013 \times 2257 \times 10^{3} \times 1.74}\right)^{3}$
$\frac{Q}{A}=4.8 \times 10^{5}$
$\mathrm{Q}=4.8 \times 10^{5} \times \frac{\pi}{4}(0.35)^{2}$

Q $=46.181 \mathrm{~kW}$
ii) Rate of evaporation( $m$ )

$$
\mathrm{Q}=\mathrm{m} \times \mathrm{h}_{\mathrm{fg}}
$$

$$
\mathrm{m}=\frac{Q}{h f g}
$$

$$
\begin{gathered}
m=\frac{46.181 \times 10^{3}}{2257 \times 10^{3}} \\
m=0.0204 \mathrm{~kg} / \mathrm{s} \\
m=73.66 \mathrm{~kg} / \mathrm{hr}
\end{gathered}
$$

iii) Critical heat flux:

$$
\begin{aligned}
& \frac{Q}{A}=0.18 h_{f g} \rho_{v}\left(\frac{\sigma g\left(\rho_{l}-\rho_{v}\right)}{\rho v^{2}}\right)^{1 / 4} \\
& \frac{Q}{A}=0.18 \times 2257 \times 10^{3} \times 0.597\left(\frac{0.0588 \times 9.81(961-0.597)}{0.597^{2}}\right)^{1 / 4} \\
& \frac{Q}{A}=1.522 \times 10^{6} \mathrm{~W} / \mathrm{m}^{2}
\end{aligned}
$$

Result :
i) Power (P)
ii) Rate of evaporation (m)
iii) Critical heat flux

$$
=46.181 \mathrm{~kW}
$$

$$
=73.66 \mathrm{~kg} / \mathrm{hr}
$$

$$
=1.522 \times 10^{6} \mathrm{~W} / \mathrm{m}^{2}
$$

3. It is desired to generate $100 \mathrm{~kg} / \mathrm{hr}$ of saturated steam at $100{ }^{\circ} \mathrm{C}$ using a heating element of copper of surface are $5 \mathrm{~m}^{2}$. Calculate the convective heat transfer coefficient and the temperature of the heating surface.

Given data:

$$
\begin{aligned}
& \dot{m}=100 \mathrm{~kg} / \mathrm{hr} \quad=100 / 3600 \\
& \dot{m}=0.0277 \mathrm{~kg} / \mathrm{s} \\
& \mathrm{~A}=5 \mathrm{~m}^{2}
\end{aligned}
$$

Saturation temperature $\left(T_{s}\right)=100 \cong \mathrm{C}$

To find:-
i) heat transfer coefficient
ii) surface temperature $\left(T_{s}\right)$

Solution:-

Saturated water Properties at $100{ }^{\circ} \mathrm{C}$
[ From HMT data book Page No: $21-6^{\text {th }}$ edition ]

$$
\begin{aligned}
v & =0.293 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s} \\
\rho_{l} & =961 \mathrm{~kg} / \mathrm{m}^{3} \\
\mathrm{C}_{\mathrm{pl}} & =4216 \mathrm{~J} / \mathrm{kg} \\
\mathrm{P}_{\mathrm{r}} & =1.74 \\
\mu_{l} & =\rho_{l} \times v \\
\mu_{l} & =281.57 \times 10^{-6} \mathrm{Ns} / \mathrm{m}^{2}
\end{aligned}
$$

From steam table, Fro $100{ }^{\circ} \mathrm{C}$

$$
\begin{aligned}
& \mathrm{h}_{\mathrm{fg}}=2256.9 \mathrm{~kJ} / \mathrm{kg} \\
& \mathrm{v}_{\mathrm{g}}=1.673 \mathrm{~m}^{3} / \mathrm{kg} \\
& \rho_{v}=\frac{1}{v_{g}} \\
& \rho_{v}=0.597 \mathrm{~kg} / \mathrm{m}^{3}
\end{aligned}
$$

At $100{ }^{\circ} \mathrm{C}$
$C_{s f}=0.013$
i) Surface temperature $\left(T_{s}\right)$
$\mathrm{Q}=\mathrm{mxh} \mathrm{h}_{\mathrm{fg}}$

$$
\begin{aligned}
& \frac{Q}{A}=\frac{\mathrm{mx} \mathrm{~h}_{\mathrm{fg}}}{A} \\
& \frac{Q}{A}=\frac{\mathrm{mx} \mathrm{~h}_{\mathrm{fg}}}{\frac{\pi}{4} d^{2}}
\end{aligned}
$$

$$
\frac{Q}{A}=\frac{0.0277 \times 2257 \times 10^{3}}{5}
$$

$$
\frac{Q}{A}=12.538 \times 10^{3} \mathrm{~W} / \mathrm{m}^{2}
$$

Heat flux $\mathrm{q}_{\mathrm{s}}=\frac{Q}{A}=\mu_{l} h_{f g}\left(\frac{g\left(\rho_{l}-\rho_{v}\right)}{\sigma}\right)^{1 / 2}\left(\frac{C_{p l} \Delta T}{C_{s f} h_{f g} P_{r}^{1.7}}\right)^{3}$
$12.538 \times 10^{3}$
$281.57 \times 10^{-6} \times 2257 \times 10^{3}\left(\frac{9.81(961-0.597)}{0.0588}\right)^{1 / 2}\left(\frac{4216 \Delta T}{0.013 \times 2257 \times 10^{3} \times 1.74}\right)^{3}$
$12.538 \times 10^{3}=44.7678 \times \Delta T^{3}$

$$
\begin{aligned}
& \Delta T=4.5 \stackrel{\circ}{\mathrm{C}} \\
& \Delta T=\left(\mathrm{T}_{\mathrm{s}}-\mathrm{T}_{\text {sat }}=4.5\right. \\
& \mathrm{T}_{\mathrm{s}}=4.5+\mathrm{T}_{\text {sat }} \\
& \mathrm{T}_{\mathrm{s}}=4.5+100 \\
& \mathrm{~T}_{\mathrm{s}}=104.5{ }^{\circ} \mathrm{C}
\end{aligned}
$$

ii) Heat transfer coefficient (h):

Q =hAdT
$\mathrm{h}=\frac{Q}{A \times \Delta T}$
$\mathrm{h}=\frac{12.538 \times 10^{3}}{4.5}$
$\mathrm{h}=2786 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$

Result :
i) the surface Temperature $\left(\mathrm{T}_{s}\right) \quad=104.5{ }^{\circ} \mathrm{C}$
ii) Heat transfer coefficient (h) $=2786 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$
4. A metal -clad heating element of 10 mm diameter and of emissivity 0.92 is submerged in a water bath horizontally. If the surface temperature of the metal is 260

## Heat exchanger

Heat exchanger may be defined as an equipment which transfer the energy from a hot fluid to cold fluid.

Examples of heat exchanger:
i) refrigerating and air-conditioning systems
ii) power systems
iii) food processing systems
iv) chemical reactors
v) space or aeronautical application
vi) steam power plants
vii) radiators in cars

Types of heat exchangers:-

Heat exchangers are classified on the basis of
i) Nature of heat exchange process
ii) Relative direction of fluid motion
iii) Design and constructional features
iv) Physical state of fluids
i) Nature of heat exchange process
a) Direct contact heat exchangers
b) Indirect contact heat exchangers
a) Direct contact heat exchangers

In a direct contact (or) open heat exchanger the exchange of heat takes place by direct mixing of hot and mass take place simultaneously.

Examples:-
i) Cooling towers
ii) Jet condensers
b) Indirect contact heat exchanger:-

In this type of heat exchanger the heat transfer between two fluids could be carried out by transmission through wall which separates the two fluids.

Examples:
i) Automobile radiators
ii) Oil coolers, intercoolers, air preheater, economizers ,super heaters
ii) Relative direction of fluid motion:-

According to the relative directions of two fluid streams the heat exchange are classified in to the following three categories
a) Parallel flow (or) unidirectional flow
b) Counter flow
c) Cross flow
a) Parallel flow heat exchanger :

Two fluid streams (hot and cold) travel in same direction.
b) Counter flow heat exchanger :

The two fluids flow in opposite direction. The hot and cold fluids enter at the opposite ends.
c) Cross flow heat exchanger:

The two fluids (hot and cold) cross one another in space. usually at right angle.
i) One fluid mixed other un mixed
ii) Both fluid unmixed

1. Design and construction :-
i) concentric tubes:
in this type two concentric tubes are used each carrying one of the fluids the direction of flow may be parallel or counter.
ii) Shell and tube

One of the fluids flows through a bundle of tubes enclosed by a shell.
a) Two tube pass one shell pass type
b) Four tube pass, two shell pass
iii) Multiple shell and tube pass
iv) Compact heat exchanger

These are special purpose heat exchanger and have a very large transfer surface area per unit volume of the exchanger. They are generally employed when convective heat transfer coefficient associated with one of the fluids is much smaller than that associated with the other fluid.

Example: Plate fin, flattened fin tube exchanger etc..
2. Physical state of fluids:

Depending upon the physical state of fluids the heat exchangers are classified as follows
i) Condensers
ii) Evaporators

## Condensers:-

In a condenser, the condensing fluid (hot fluid) remains at constant temperature throughout the exchanger while the temperature of the colder fluid gradually increases from inlet to outlet.

Heat exchanger Analysis:-

For designing (or) predicting the performance of a heat exchanger it is necessary that the total heat transfer may be related with its governing parameters.
i) $\quad \mathrm{U}$ (overall heat transfer coefficient)
ii) A total surface area of the heat transfer
iii) Inlet and outlet fluid temperature.

$$
\begin{aligned}
& \mathrm{m}=\text { mass flow rate }, \mathrm{kg} / \mathrm{s} \\
& \mathrm{Cp} \quad=\text { Specific heat of fluid at constant pressure } \mathrm{J} / \mathrm{kgK} . \\
& \mathrm{T} \quad=\text { Temperature of fluid }{ }^{\circ} \mathrm{C}
\end{aligned}
$$

$\Delta T=$ Temperature drop (or) rise of the fluid across the heat exchanger

Heat lost by the hot fluid

$$
\mathrm{Q}=\mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{ph}}\left(\mathrm{~T}_{\mathrm{h} 1}-\mathrm{T}_{\mathrm{h} 2}\right)
$$

Heat gain by the cold fluid

$$
\mathrm{Q}=\mathrm{m}_{\mathrm{c}} \mathrm{C}_{\mathrm{pc}}\left(\mathrm{~T}_{\mathrm{c} 2}-\mathrm{T}_{\mathrm{c} 1}\right)
$$

Total heat transfer rate in the heat exchanger

$$
\begin{aligned}
\mathrm{Q} & =\mathrm{U} \mathrm{~A} \Delta T_{m} \\
\Delta T_{m} & =\text { Logarithmic Mean Temperature Difference (LMDT) }
\end{aligned}
$$

## Logarithmic Mean Temperature Difference (LMDT)

The following assumptions are made :-

1. the overall heat transfer coefficient $U$ is constant
2. the flow conditions are steady
3. the specific heats and mass flow rates of both fluids are constant
4. There is no change of phase either of the fluid during the heat transfer.
5. there is no loss of heat to the surroundings , due to the heat exchanger being perfectly insulated.
6. The changes in potential and kinetic energies are negligible.
7. Axial condition along the tubes of the heat exchanger is negligible.

## Logarithmic Mean Temperature Difference (LMDT) for "Parallel flow"

Let us consider an elementary area dA of the heat exchanger. The rate of flow of heat through this elementary are,

$$
\begin{aligned}
& \mathrm{dQ}=\mathrm{UdA}\left(\mathrm{~T}_{\mathrm{h}}-\mathrm{T}_{\mathrm{c}}\right) \\
& \mathrm{dQ}=\mathrm{UdA} \Delta T_{m}
\end{aligned}
$$

in a Parallel flow system, the temperature of hot fluid decrease in the direction of heat exchanger length, hence the - Ve sign

Heat lost by the hot fluid

$$
\begin{aligned}
d Q & =m_{h} C_{p h}\left(T_{h 1}-T_{h 2}\right) \\
d Q & =-m_{h} C_{p h}\left(T_{h 2}-T_{h 1}\right) \\
d Q & =-m_{h} C_{p h} d T_{h} \\
d Q & =-m_{h} C_{p h} d T_{h} \\
d T_{h} & =-\frac{d Q}{m_{h} C_{p h}} \\
d T_{h} & =-\frac{d Q}{C_{h}}
\end{aligned}
$$

$C_{h}=$ Heat capacity of hot fluid

Heat gain by the cold fluid

$$
\begin{aligned}
& d Q=m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
& d Q \quad=m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
& d Q \quad=m_{c} C_{p c} d T_{c} \\
& d Q \quad=m_{c} C_{p c} d T_{c}
\end{aligned}
$$

$$
\mathrm{d} \mathrm{~T}_{\mathrm{c}}=\frac{d Q}{m_{c} C_{p c}}
$$

$$
\mathrm{dT}_{\mathrm{c}}=\frac{d Q}{C_{c}}
$$

## $\mathrm{C}_{\mathrm{c}}=$ Heat capacity of cold fluid

$$
\begin{aligned}
\mathrm{dT}_{h}-\mathrm{dT} \mathrm{c}_{c} & =-\frac{d Q}{C_{h}}-\frac{d Q}{C_{c}} \\
& =-\mathrm{dQ}\left(\frac{1}{C_{h}}+\frac{1}{C_{c}}\right) \\
& =-\mathrm{UdA}\left(T_{\mathrm{h}}-\mathrm{T}_{c}\right)\left(\frac{1}{C_{h}}+\frac{1}{C_{c}}\right) \\
\mathrm{dQ} & =-\mathrm{UdA} \theta\left(\frac{1}{C_{h}}+\frac{1}{C_{c}}\right) \\
\frac{d \theta}{\theta} & =-\mathrm{UdA}\left(\frac{1}{C_{h}}+\frac{1}{C_{c}}\right)
\end{aligned}
$$

Integrating between inlet and outlet conditions

Area $\quad A=0$ to $A=A$

$$
\begin{aligned}
\int_{1}^{2} \frac{d \theta}{\theta} & =\int_{0}^{A}-\mathrm{UdA}\left(\frac{1}{C_{h}}+\frac{1}{C_{c}}\right) \\
{[\ln (\theta)]_{1}^{2} } & =-\mathrm{U}\left(\frac{1}{C_{h}}+\frac{1}{C_{c}}\right)[A]_{0}^{A} \\
\ln \left(\theta_{2}\right)-\ln \left(\theta_{1}\right) & =-\mathrm{UA}\left(\frac{1}{C_{h}}+\frac{1}{C_{c}}\right)
\end{aligned}
$$

$$
\ln \left(\frac{\theta_{2}}{\theta_{1}}\right)=-\cup \mathrm{A}\left(\frac{1}{C_{h}}+\frac{1}{C_{c}}\right)
$$

$$
\begin{aligned}
\mathrm{Q} & =\mathrm{C}_{\mathrm{h}}\left(\mathrm{~T}_{\mathrm{h} 1}-\mathrm{T}_{\mathrm{h} 2}\right) \\
\frac{1}{C_{h}} & =\frac{\mathrm{T}_{\mathrm{h} 1}-\mathrm{T}_{\mathrm{h} 2}}{Q} \\
\mathrm{Q} & =\mathrm{C}_{\mathrm{c}}\left(\mathrm{~T}_{\mathrm{c} 2}-\mathrm{T}_{\mathrm{c} 1}\right) \\
\frac{1}{C_{c}} & =\frac{\mathrm{T}_{\mathrm{c} 2}-\mathrm{T}_{\mathrm{c} 1}}{Q}
\end{aligned}
$$

Substitute $1 / C_{h}, 1 / C_{c}$ Value in equation - 1

$$
\begin{aligned}
\ln \left(\frac{\theta_{2}}{\theta_{1}}\right) & =-\cup \mathrm{A}\left(\frac{T_{h 1}-T_{h 2}}{Q}+\frac{T_{c 2}-T_{c 1}}{Q}\right) \\
\ln \left(\frac{\theta_{2}}{\theta_{1}}\right) & =-\cup \mathrm{A}\left(\frac{\left(T_{h 1}-T_{c 1}\right)-\left(T_{h 2}-T_{c 2}\right)}{Q}\right) \\
\ln \left(\frac{\theta_{2}}{\theta_{1}}\right) & =-\cup \mathrm{A}\left(\frac{\theta_{1}-\theta_{2}}{Q}\right) \\
\mathrm{Q} & =-\cup \mathrm{A}\left(\frac{\theta_{1}-\theta_{2}}{\ln \left(\frac{\theta_{2}}{\theta_{1}}\right)}\right) \\
\mathrm{Q} & =\mathrm{UA} \frac{\theta_{1}-\theta_{2}}{\ln \left(\frac{\theta_{1}}{\theta_{2}}\right)} \\
\mathrm{Q} & =\mathrm{UA} \theta_{\mathrm{m}}
\end{aligned}
$$

$$
\begin{gathered}
\theta_{\mathrm{m}}=\frac{\theta_{1}-\theta_{2}}{\ln \left(\frac{\theta_{1}}{\theta_{2}}\right)}=\Delta T_{m}=\text { Logarithmic Mean Temperature Difference (LMDT) } \\
\theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 1}\right)-\left(T_{h 2}-T_{c 2}\right)}{\ln \left(\frac{T_{h 1}-T_{c 1}}{T_{h 2}-T_{c 2}}\right)}
\end{gathered}
$$

## Logarithmic Mean Temperature Difference (LMDT) for "Counter flow"

Let us consider an elementary area dA of the heat exchanger. The rate of flow of heat through this elementary are,

in a counter flow system, the temperature of both the fluids decrease in the direction of heat exchanger length, hence the - Ve sign

Heat lost by the hot fluid

$$
\begin{aligned}
d Q & =m_{h} C_{p h}\left(T_{h 1}-T_{h 2}\right) \\
d Q & =-m_{h} C_{p h}\left(T_{h 2}-T_{h 1}\right)
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{dQ} & =-\mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{ph}} \mathrm{~d} \mathrm{~T}_{\mathrm{h}} \\
\mathrm{dQ} & =-\mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{ph}} \mathrm{~d} \mathrm{~T}_{\mathrm{h}} \\
\mathrm{~d} \mathrm{~T}_{\mathrm{h}} & =-\frac{d Q}{m_{h} C_{p h}} \\
\mathrm{dT}_{\mathrm{h}} & =-\frac{d Q}{C_{h}}
\end{aligned}
$$

$C_{h}=$ Heat capacity of hot fluid

Heat gain by the cold fluid

$$
\begin{aligned}
d Q & =-m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
d Q & =-m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
d Q \quad & =-m_{c} C_{p c} d T_{c} \\
d Q & =-m_{c} C_{p c} d T_{c} \\
d T_{c} & =-\frac{d Q}{m_{c} C_{p c}} \\
d T_{c} & =-\frac{d Q}{C_{c}}
\end{aligned}
$$

$C_{c}=$ Heat capacity of cold fluid

$$
\begin{aligned}
\mathrm{dT}_{\mathrm{h}}-\mathrm{dT}_{c} & =-\frac{d Q}{C_{h}}+\frac{d Q}{C_{c}} \\

& Q=U A \theta_{m} \\
& \theta_{m}=\frac{\theta_{1}-\theta_{2}}{\ln \left(\frac{\theta_{1}}{\theta_{2}}\right)}=\Delta T_{m}=\text { Logarithmic Mean Temperature Difference (LMDT) } \\
& \theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 2}\right)-\left(T_{h 2}-T_{c 1}\right)}{\ln \left(\frac{T_{h 1}-T_{c 2}}{T_{h 2}-T_{c 1}}\right)}
\end{aligned}
$$

## Overall heat transfer co-efficient:-

If the fluids are separated by a tube wall as shown in fig. the overall heat transfer coefficient is given by,

Considering inner surface :

$$
\mathrm{U}_{\mathrm{i}}=\frac{1}{\frac{1}{h_{i}}+\frac{r_{i}}{K} \ln \left(\frac{r_{o}}{r_{i}}\right)+\frac{r_{i}}{r_{o}}\left(\frac{1}{h_{o}}\right)}
$$

Considering Outer surface :

$$
\mathrm{U}_{\circ}=\frac{1}{\frac{1}{h_{i}}\left(\frac{r_{0}}{r_{i}}\right)+\frac{r_{0}}{K} \ln \left(\frac{r_{o}}{r_{i}}\right)+\frac{1}{h_{o}}}
$$

The heat exchanger ,considering the thermal resistance due to scale formation is given by,

## Considering inner surface

$$
\mathrm{U}_{\mathrm{i}}=\frac{1}{\frac{1}{h_{i}}+R_{f i}+\frac{r_{i}}{K} \ln \left(\frac{r_{o}}{r_{i}}\right)+\frac{r_{i}}{r_{o}} R_{f 0}+\frac{r_{i}}{r_{o}}\left(\frac{1}{h_{o}}\right)}
$$

Considering Outer surface :

$$
\mathrm{U}_{0}=\frac{1}{\frac{1}{h_{i}}\left(\frac{r_{0}}{r_{i}}\right)+\frac{r_{0}}{r_{i}} R_{f i}+\frac{r_{0}}{K} \ln \left(\frac{r_{o}}{r_{i}}\right)+R_{f 0}+\frac{1}{h_{o}}}
$$

Incase of thin walled surface

$$
U_{0}=\frac{1}{\frac{1}{h_{i}}+\frac{1}{h_{o}}}
$$

When only, fouling factors are neglected

$$
\mathrm{U}_{0}=\frac{1}{\frac{1}{h_{i}}\left(\frac{r_{0}}{r_{i}}\right)+\frac{r_{0}}{K} \ln \left(\frac{r_{o}}{r_{i}}\right)+\frac{1}{h_{o}}}
$$

1. the flow rate of hot and cold water streams running through a parallel flow heat exchanger are $0.2 \mathrm{~kg} / \mathrm{s}$ and $0.5 \mathrm{~kg} / \mathrm{s}$ respectively. The inlet temperatures on the hot and cold sides are $75{ }^{\circ} \mathrm{C}$ and $20{ }^{\circ} \mathrm{C}$ respectively. The exit temperature of hot water is $45{ }^{\circ} \mathrm{C}$. if the overall heat transfer coefficient is $350 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. Calculate the area of the heat exchanger.

Given :

$$
\begin{aligned}
m_{h} & =0.2 \mathrm{~kg} / \mathrm{s} \\
\mathrm{~m}_{\mathrm{c}} & =0.5 \mathrm{~kg} / \mathrm{s} \\
\mathrm{~T}_{\mathrm{h} 1} & =75 \varrho \mathrm{C} \\
\mathrm{~T}_{\mathrm{c} 1} & =20 \varrho \mathrm{C} \\
\mathrm{~T}_{\mathrm{h} 2} & =45 \varrho \mathrm{C} \\
U & =350 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
\mathrm{C}_{\mathrm{ph}} & =4187 \mathrm{~J} / \mathrm{kgK}=\mathrm{C}_{\mathrm{pc}}
\end{aligned}
$$

To find :

Area of the heat exchanger,

Solution:

Heat lost by the hot fluid

$$
Q=m_{h} C_{p h}\left(T_{h 1}-T_{h 2}\right)
$$

$$
=0.2 \times 4187 \times(75-45)
$$

$$
=25,122 \mathrm{~W}
$$

Heat lost by the hot fluid = Heat gain by the cold fluid

$$
\mathrm{Q}=\mathrm{m}_{\mathrm{c}} \mathrm{C}_{\mathrm{pc}}\left(\mathrm{~T}_{\mathrm{c} 2}-T_{\mathrm{c} 1}\right)
$$

$$
25,122=0.5 \times 4187 \times\left(\mathrm{T}_{\mathrm{c} 2}-20\right)
$$

$$
\mathrm{T}_{\mathrm{c} 2}=\frac{25,122}{0.5 \times 4187}+20
$$

$$
\mathrm{T}_{\mathrm{c} 2}=32{ }^{\circ} \mathrm{C}
$$

$$
\theta_{\mathrm{m}} \quad=\frac{\left(T_{h 1}-T_{c 1}\right)-\left(T_{h 2}-T_{c 2}\right)}{\ln \left(\frac{T_{h 1}-T_{c 1}}{T_{h 2}-T_{c 2}}\right)}
$$

$$
\theta_{m}=\frac{(75-20)-(45-32)}{\ln \left(\frac{75-20}{45-32}\right)}
$$

$$
\theta_{\mathrm{m}}=29.12 \circ \mathrm{C}
$$

Heat transfer rate

$$
\begin{aligned}
& \mathrm{Q}=U \mathrm{~A} \theta_{\mathrm{m}} \\
& \mathrm{~A}=\frac{Q}{U \theta_{m}} \\
& \mathrm{~A}=\frac{25,122}{350 \times 29.12}
\end{aligned}
$$

$$
A=2.46 \mathrm{~m}^{2}
$$

Result :

$$
\text { Heat transfer area } \mathrm{A}=2.46 \mathrm{~m}^{2}
$$

2. in a double pipe counter flow heat exchanger $10,000 \mathrm{~kg} / \mathrm{hr}$ of an oil having a specific heat of $2095 \mathrm{~J} / \mathrm{kgK}$ is cooled from $80{ }^{\circ} \mathrm{C}$ to $50{ }^{\circ} \mathrm{C}$ by $8000 \mathrm{~kg} / \mathrm{hr}$ of water entering at $25{ }^{\circ} \mathrm{C}$. Determine the heat exchanger area for an overall heat transfer coefficient of $300 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. take Cp for water as $4180 \mathrm{~J} / \mathrm{kgK}$.

Given :

$$
\begin{aligned}
\text { Hot fluid } & =\text { Oil } \\
\text { Cold fluid } & =\text { Water } \\
m_{h} & =10,000 \mathrm{~kg} / \mathrm{hr} \\
& =10,000 / 3600=2.78 \mathrm{~kg} / \mathrm{s} \\
\mathrm{~m}_{\mathrm{c}} & =8000 \mathrm{~kg} / \mathrm{hr} \\
& =8000 / 3600=2.22 \mathrm{~kg} / \mathrm{s} \\
\mathrm{~T}_{\mathrm{h} 1} & =80 \circ \mathrm{C} \\
\mathrm{~T}_{\mathrm{h} 2} & =50 \circ \mathrm{C} \\
\mathrm{~T}_{\mathrm{c} 1} & =25 \circ \mathrm{C} \\
\mathrm{U} & =300 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
\mathrm{C}_{\mathrm{ph}} & =2095 \mathrm{~J} / \mathrm{kgK} \\
& =4180 \mathrm{~J} / \mathrm{kgK}
\end{aligned}
$$

To find :

Area of the heat exchanger,

Solution:

Heat lost by the hot fluid
$\mathrm{Q}=\mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{ph}}\left(\mathrm{T}_{\mathrm{h} 1}-\mathrm{T}_{\mathrm{h} 2}\right)$
$=2.78 \times 2095 \times(80-50)$
$=174583 \mathrm{~W}$

Heat lost by the hot fluid = Heat gain by the cold fluid

$$
\begin{aligned}
\mathrm{Q} & =\mathrm{m}_{\mathrm{c}} \mathrm{C}_{\mathrm{pc}}\left(\mathrm{~T}_{\mathrm{c} 2}-\mathrm{T}_{\mathrm{c} 1}\right) \\
174583 & =2.22 \times 4180 \times\left(\mathrm{T}_{\mathrm{c} 2}-25\right) \\
\mathrm{T}_{\mathrm{c} 2} & =\frac{174583}{2.22 \times 4180}+25 \\
\mathrm{~T}_{\mathrm{c} 2} & =43.8{ }^{\circ} \mathrm{C}
\end{aligned}
$$

For counter Flow, $\quad \theta_{\mathrm{m}} \quad=\frac{\left(T_{h 1}-T_{c 2}\right)-\left(T_{h 2}-T_{c 1}\right)}{\ln \left(\frac{T_{h 1}-T_{c 2}}{T_{h 2}-T_{c 1}}\right)}$

$$
\theta_{\mathrm{m}}=\frac{(80-43.8)-(50-25)}{\ln \left(\frac{80-43.5}{50-25}\right)}
$$

$$
\theta_{\mathrm{m}}=29.6{ }^{\circ} \mathrm{C}
$$

Heat transfer rate

$$
\mathrm{Q}=\mathrm{UA} \theta_{\mathrm{m}}
$$

$$
\mathrm{A}=\frac{Q}{U \theta_{m}}
$$

$$
A=\frac{174583}{300 \times 29.6}
$$

$$
A=19.66 \mathrm{~m}^{2}
$$

## Result:

Heat transfer area $A=19.66 \mathrm{~m}^{2}$
3. Hot oil with a capacity rate of $2500 \mathrm{~W} / \mathrm{K}$ flows through a double pipe heat exchanger. It enters at $360{ }^{\circ} \mathrm{C}$ and leaves at $300{ }^{\circ} \mathrm{C}$ cold fluid enters at $30{ }^{\circ} \mathrm{C}$ and leaves at $200{ }^{\circ} \mathrm{C}$. If the overall heat transfer coefficient is $800 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$, Determine the heat exchanger area required for a) Parallel Flow b) Counter Flow.

## Given :

$$
\begin{aligned}
\text { Hot fluid } & =\text { Oil } \\
\text { Cold fluid } & =\text { Water } \\
T_{h 1} & =360 \circ \mathrm{O} \\
T_{h 2} & =300{ }^{\circ} \mathrm{C} \\
T_{\mathrm{c} 1} & =30 \cong \mathrm{C} \\
T_{\mathrm{c} 2} & =200 \cong \mathrm{C} \\
\mathrm{U} & =800 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
\text { Heat Capacity } \mathrm{C}_{\mathrm{h}} \quad & =2095 \mathrm{~J} / \mathrm{kgK}=\mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{ph}}
\end{aligned}
$$

To find :

Area of the heat exchanger, for
a) Parallel flow
b) Counter flow

Solution:

Heat lost by the hot fluid

$$
\begin{aligned}
Q & =m_{h} C_{p h}\left(T_{h 1}-T_{h 2}\right) \\
& =2500 \times(360-300) \\
& =150000 \mathrm{~W}
\end{aligned}
$$

a) For parallel flow :

$$
\theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 1}\right)-\left(T_{h 2}-T_{c 2}\right)}{\ln \left(\frac{T_{h 1}-T_{c 1}}{T_{h 2}-T_{c 2}}\right)}
$$

$$
\theta_{m}=\frac{(360-30)-(300-200)}{\ln \left(\frac{360-30}{300-200}\right)}
$$

$$
\theta_{\mathrm{m}}=192.64 \varrho^{\circ} \mathrm{C}
$$

Heat transfer rate

$$
\begin{aligned}
& \mathrm{Q}=U A \theta_{\mathrm{m}} \\
& \mathrm{~A}=\frac{Q}{U \theta_{m}} \\
& \mathrm{~A}=\frac{15000}{800 \times 192.64} \\
& \mathrm{~A}=0.973 \mathrm{~m}^{2}
\end{aligned}
$$

b) For counter Flow, $\theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 2}\right)-\left(T_{h 2}-T_{c 1}\right)}{\ln \left(\frac{T_{h 1}-T_{c 2}}{T_{h 2}-T_{c 1}}\right)}$

$$
\theta_{\mathrm{m}}=\frac{(360-200)-(300-30)}{\ln \left(\frac{360-200}{300-30}\right)}
$$

$$
\theta_{\mathrm{m}}=210.22{ }^{\circ} \mathrm{C}
$$

Heat transfer rate

$$
Q=U A \theta_{\mathrm{m}}
$$

$$
\begin{aligned}
& \mathrm{A}=\frac{Q}{U \theta_{m}} \\
& \mathrm{~A}=\frac{150000}{800 \times 210.22} \\
& \mathrm{~A}=0.892 \mathrm{~m}^{2}
\end{aligned}
$$

Result :

The surface area required for a counter flow arrangement is less than that in a parallel flow arrangement
4. A counter flow concentric tube heat exchanger is used to cool engine oil ( $C_{p}=2130 \mathrm{~J} / \mathrm{kgK}$ ) from $160{ }^{\circ} \mathrm{C}$ to $60{ }^{\circ} \mathrm{C}$ with water available at $25{ }^{\circ} \mathrm{C}$ as the cooling medium. The flow rate of cooling water through the inner tube of 0.5 m diameter is $2 \mathrm{~kg} / \mathrm{s}$ while the flow rate of oil through the outer tube is $2 \mathrm{~kg} / \mathrm{s}$. If the value of the overall heat transfer coefficient is $250 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$, What length must the heat exchanger be to meet its cooling requirement?

Given:

$$
\begin{aligned}
& \text { Hot fluid }=\text { Engine Oil } \\
& \text { Cold fluid }=\text { Water }
\end{aligned}
$$

$$
m_{h}=2 \mathrm{~kg} / \mathrm{s}
$$

$$
m_{c}=2 \mathrm{~kg} / \mathrm{s}
$$

$$
T_{h 1}=160 \circ \mathrm{C}
$$

$$
T_{h 2}=60 \cong \mathrm{O}
$$

$$
\mathrm{T}_{\mathrm{c} 1}=25{ }^{\circ} \mathrm{C}
$$

$$
\mathrm{U}=250 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
$$

$$
\mathrm{C}_{\mathrm{ph}}=2130 \mathrm{~J} / \mathrm{kgK}
$$

$$
\begin{aligned}
\mathrm{C}_{\mathrm{pc}} & =4187 \mathrm{~J} / \mathrm{kgK} \\
\mathrm{~d} & =0.5 \mathrm{~m}
\end{aligned}
$$

To find :

Length of heat exchanger,

Solution:

Heat lost by the hot fluid

$$
\begin{aligned}
\begin{aligned}
& \mathrm{Q}=\mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{ph}}\left(\mathrm{~T}_{\mathrm{h} 1}-\mathrm{T}_{\mathrm{h} 2}\right) \\
&=2 \times 2130 \times(160-60) \\
&=426000 \mathrm{~W} \\
& \text { Heat lost by the hot fluid }=\text { Heat gain by the cold fluid } \\
& \mathrm{Q}=\mathrm{m}_{\mathrm{c}} \mathrm{C}_{\mathrm{pc}}\left(\mathrm{~T}_{\mathrm{c} 2}-\mathrm{T}_{\mathrm{c} 1}\right) \\
& 426000=2 \times 4187 \times\left(\mathrm{T}_{\mathrm{c} 2}-25\right) \\
& \mathrm{T}_{\mathrm{c} 2}=\frac{426000}{2 \times 4187}+25 \\
& \mathrm{~T}_{\mathrm{c} 2}=75.87 \mathrm{o}^{\circ} \mathrm{C} \\
& \text { For counter Flow, } \quad \theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 2}\right)-\left(T_{h 2}-T_{c 1}\right)}{\ln \left(\frac{T_{h 1}-T_{c 2}}{T_{h 2}-T_{c 1}}\right)} \\
& \theta_{\mathrm{m}}=56.020 \mathrm{C} \\
& \theta_{\mathrm{m}}=\frac{(160-75.87)-(60-25)}{\ln \left(\frac{160-75.87}{60-25}\right)} \\
& \\
&
\end{aligned} \\
\end{aligned}
$$

Heat transfer rate

$$
\mathrm{Q}=\mathrm{UA} \theta_{\mathrm{m}}
$$

$\mathrm{A}=\frac{Q}{U \theta_{m}}$
$A=\frac{426000}{250 \times 56.02}$
$A=30.417 \mathrm{~m}^{2}$

A $\quad=\pi x d x L$
$\mathrm{L}=\frac{A}{\pi \times d}$
$\mathrm{L}=\frac{30.417}{\pi \times 0.5}$
$\mathrm{L}=19.36 \mathrm{~m}$

Result :

Length of heat exchanger $L=19.36 \mathrm{~m}$
5. Saturated steam at $120{ }^{\circ} \mathrm{C}$ is condensing on the outer tube surface of a single pass heat exchanger. The heat transfer co-efficient is $U_{0}=1800 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. Determine the surface area of a heat exchanger capable of heating $1000 \mathrm{~kg} / \mathrm{hr}$ of water $20^{\circ} \mathrm{C}$ to $90{ }^{\circ} \mathrm{C}$. Also compute the rate of condensation of steam. Take $\mathrm{h}_{\mathrm{fg}}=2200 \mathrm{~kJ} / \mathrm{kg}$

Given :

$$
\begin{aligned}
& \text { Hot fluid }=\text { Steam } \\
& \text { Cold fluid }=\text { Water }
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{T}_{\mathrm{h} 1} & =120 \varrho^{\circ} \mathrm{C}=\mathrm{T}_{\mathrm{h} 2} \quad \text { (For condenser) } \\
\mathrm{T}_{\mathrm{c} 1} & =20{ }^{\circ} \mathrm{C} \\
\mathrm{~T}_{\mathrm{c} 2} & =90{ }^{\circ} \mathrm{C} \\
\mathrm{~m}_{\mathrm{c}} & =1000 \mathrm{~kg} / \mathrm{hr} \\
& =1000 / 3600=0.278 \mathrm{~kg} / \mathrm{s} \\
\mathrm{U}_{0} & =1800 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
\mathrm{C}_{\mathrm{pc}} & =4187 \mathrm{~J} / \mathrm{kgK} \\
\mathrm{~h}_{\mathrm{fg}} \quad & =2200 \mathrm{~kJ} / \mathrm{kg}
\end{aligned}
$$

To find :
i) Heat transfer Area
ii)The rate of condensation of steam

## Solution:

Heat lost by the hot fluid

$$
\begin{aligned}
Q \quad & =m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
& =0.278 \times 4187 \times(90-20) \\
& =81413.89 \mathrm{~W}
\end{aligned}
$$

For parallel flow :

$$
\begin{aligned}
& \theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 1}\right)-\left(T_{h 2}-T_{c 2}\right)}{\ln \left(\frac{T_{h 1}-T_{c 1}}{T_{h 2}-T_{c 2}}\right)} \\
& \theta_{\mathrm{m}}=\frac{(120-20)-(120-90)}{\ln \left(\frac{120-20}{120-90}\right)}
\end{aligned}
$$

$$
\theta_{\mathrm{m}}=58.14 \varrho \mathrm{O} \mathrm{C}
$$

Heat transfer rate

$$
\begin{aligned}
& \mathrm{Q}=U A \theta_{\mathrm{m}} \\
& \mathrm{~A}=\frac{Q}{U \theta_{m}} \\
& \mathrm{~A}=\frac{81413.89}{1800 \times 58.14} \\
& \mathrm{~A}=0.78 \mathrm{~m}^{2} \\
& \mathrm{Q}=\mathrm{m} \times \mathrm{h}_{\mathrm{fg}} \\
& \mathrm{~m}=\frac{\mathrm{Q}}{\mathrm{~h}_{\mathrm{fg}}} \\
& \mathrm{~m}=\frac{81413.89}{2200 \times 10^{3}} \\
& \mathrm{~m}=0.037 \mathrm{~kg} / \mathrm{s} \quad \text { (or) } 133.22 \mathrm{~kg} / \mathrm{hr}
\end{aligned}
$$

Result :
i) Heat transfer area $A=0.78 \mathrm{~m}^{2}$
ii) The rate of condensation of steam $m=133.22 \mathrm{~kg} / \mathrm{hr}$
6. in a counter flow double pipe heat exchanger, water is heated from $25{ }^{\circ} \mathrm{C}$ to $65{ }^{\circ} \mathrm{C}$ by an oil with a specific heat of $1.45 \mathrm{~kJ} / \mathrm{kgK}$ and mass flow rate of $0.9 \mathrm{~kg} / \mathrm{s}$. the oil is cooled from $230{ }^{\circ} \mathrm{C}$ to 160 ${ }^{\circ} \mathrm{C}$. if the overall heat transfer coefficient is $420 \mathrm{~W} / \mathrm{m} 2 \mathrm{~K}$, Calculate the following
i. The rate of heat transfer
ii. The mass flow rate of water
iii. The surface area of the Heat exchanger

Given:

$$
\begin{aligned}
& \text { Hot fluid = Engine Oil } \\
& \text { Cold fluid }=\text { Water }
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{h} 1}=230 \bigcirc \mathrm{O} \\
& \mathrm{~T}_{\mathrm{h} 2}=160 \circ \mathrm{O} \\
& \mathrm{~T}_{\mathrm{c} 1}=25 \mathrm{O}^{\circ} \mathrm{C} \\
& \mathrm{~T}_{\mathrm{c} 2}=65 \mathrm{O}^{\circ} \mathrm{C} \\
& \mathrm{~m}_{\mathrm{h}}=0.9 \mathrm{~kg} / \mathrm{s} \\
& \mathrm{U}=420 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
& \mathrm{C}_{\mathrm{ph}}=1.450 \mathrm{~kJ} / \mathrm{kgK}=1450 \mathrm{~J} / \mathrm{kgK} \\
& \mathrm{C}_{\mathrm{pc}}=4187 \mathrm{~J} / \mathrm{kgK}
\end{aligned}
$$

To find :
i. The rate of heat transfer
ii. The mass flow rate of water
iii. The surface area of the Heat exchanger

Solution:
i) The rate of heat transfer:

Heat lost by the hot fluid

$$
\mathrm{Q}=\mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{ph}}\left(\mathrm{~T}_{\mathrm{h} 1}-\mathrm{T}_{\mathrm{h} 2}\right)
$$

$$
\begin{aligned}
& =0.9 \times 1450 \times(230-160) \\
& =91350 \mathrm{~W}
\end{aligned}
$$

ii) The mass flow rate of water:

Heat lost by the hot fluid = Heat gain by the cold fluid

$$
\begin{aligned}
Q & =m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
91350 & =m_{c} \times 4187 \times(65-25) \\
m_{c} & =\frac{91350}{4187 \times(65-25)} \\
m_{c} & =0.545 \mathrm{~kg} / \mathrm{s}
\end{aligned}
$$

iii) surface area of heat exchanger:

$$
\text { For counter Flow, } \begin{aligned}
\theta_{\mathrm{m}} & =\frac{\left(T_{h 1}-T_{c 2}\right)-\left(T_{h 2}-T_{c 1}\right)}{\ln \left(\frac{T_{h 1}-T_{c 2}}{T_{h 2}-T_{c 1}}\right)} \\
\theta_{\mathrm{m}} & =\frac{(230-65)-(160-25)}{\ln \left(\frac{230-65}{160-25}\right)} \\
\theta_{\mathrm{m}} & =149.5 \circ \mathrm{C}
\end{aligned}
$$

Heat transfer rate

$$
Q=U A \theta_{m}
$$

$$
\mathrm{A}=\frac{Q}{U \theta_{m}}
$$

$$
A=\frac{91350}{420 \times 149.5}
$$

$$
\mathrm{A}=1.45 \mathrm{~m}^{2}
$$

Result :
i. The rate of heat transfer $\mathrm{Q}=91350 \mathrm{~W}$
ii. The mass flow rate of water $\mathrm{m}_{\mathrm{c}}=0.545 \mathrm{~kg} / \mathrm{s}$
iii. The surface area of heat exchanger $A=1.45 \mathrm{~m}^{2}$
7. An oil cooler for a lubrication system has to cool $1000 \mathrm{~kg} / \mathrm{hr}$ of oil ( $\mathrm{Cp}=2.09 \mathrm{~kJ} / \mathrm{kgK}$ ) from $80{ }^{\circ} \mathrm{C}$ to $40{ }^{\circ} \mathrm{C}$ by using a cooling water flow of $1000 \mathrm{~kg} / \mathrm{hr}$ at $30{ }^{\circ} \mathrm{C}$. Give your choice for a parallel flow or counter flow heat exchanger with reasons. Calculate the surface area of the heat exchanger, if the overall heat transfer coefficient is $24 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$.

Given:

$$
\begin{aligned}
\text { Hot fluid } & =\text { Engine Oil } \\
\text { Cold fluid } & =\text { Water } \\
\mathrm{C}_{\mathrm{ph}} & =2.09 \mathrm{~kJ} / \mathrm{kgK}=2090 \mathrm{~J} / \mathrm{kgK} \\
\mathrm{~m}_{\mathrm{h}} & =1000 \mathrm{~kg} / \mathrm{hr} \\
& =1000 / 3600=0.278 \mathrm{~kg} / \mathrm{s} \\
\mathrm{~T}_{\mathrm{h} 1} & =80{ }^{\circ} \mathrm{C} \\
\mathrm{~T}_{\mathrm{h} 2} & =400^{\circ} \mathrm{C} \\
\mathrm{~T}_{\mathrm{c} 1} & =300 \mathrm{C} \\
\mathrm{~m}_{\mathrm{c}} & =1000 \mathrm{~kg} / \mathrm{hr} \\
& =1000 / 3600=0.278 \mathrm{~kg} / \mathrm{s} \\
U & =24 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
\end{aligned}
$$

$$
\mathrm{C}_{\mathrm{pc}}=4187 \mathrm{~J} / \mathrm{kgK}
$$

To find :

The surface area of the Heat exchanger

## Solution:

Heat lost by the hot fluid

$$
\begin{aligned}
\mathrm{Q} & =m_{h} C_{p h}\left(T_{h 1}-T_{h 2}\right) \\
& =0.278 \times 2090 \times(80-40) \\
& =23222 \mathrm{~W}
\end{aligned}
$$

ii) The mass flow rate of water:

Heat lost by the hot fluid = Heat gain by the cold fluid

$$
\begin{aligned}
\mathrm{Q} & =m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
23222 & =0.278 \times 4187 \times\left(T_{c 2}-40\right)
\end{aligned}
$$

$$
T_{c 2}=\frac{23222}{0.278 \times 4187}+30
$$

$$
\mathrm{T}_{\mathrm{c} 2}=50{ }^{\circ} \mathrm{C}
$$

$$
\mathrm{T}_{\mathrm{c} 2}>\mathrm{T}_{\mathrm{h} 2}
$$

So, counter flow arrangement must be used

Surface area of heat exchanger:

$$
\text { For counter Flow, } \theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 2}\right)-\left(T_{h 2}-T_{c 1}\right)}{\ln \left(\frac{T_{h 1}-T_{c 2}}{T_{h 2}-T_{c 1}}\right)}
$$

$$
\begin{aligned}
\theta_{\mathrm{m}} & =\frac{(80-50)-(40-30)}{\ln \left(\frac{80-50}{40-30}\right)} \\
\theta_{\mathrm{m}} & =18.2 \circ \mathrm{C}
\end{aligned}
$$

Heat transfer rate

$$
\mathrm{Q}=\mathrm{UA} \theta_{\mathrm{m}}
$$

$\mathrm{A}=\frac{Q}{U \theta_{m}}$
$A=\frac{23222}{24 \times 18.2}$
$A=53.15 \mathrm{~m}^{2}$

Result :

Surface area of the heat exchanger $A=53.15 \mathrm{~m}^{2}$
8. A counter flow double pipe heat exchanger using superheated steam is used to hot water at the rate of $10500 \mathrm{~kg} / \mathrm{hr}$. the steam enter the heat exchanger at $200{ }^{\circ} \mathrm{C}$ and leaves at $130{ }^{\circ} \mathrm{C}$. The inlet and exit temperature of water are $30{ }^{\circ} \mathrm{C}$ and $80{ }^{\circ} \mathrm{C}$ respectively. If overall heat transfer coefficient from steam t water is $814 \mathrm{~W} / \mathrm{m} 2 \mathrm{~K}$, calculate the heat transfer area. What would be the increase in area in the fluid flows were in parallel?

Given:

$$
\begin{aligned}
\text { Hot fluid } & =\text { steam } \\
\text { Cold fluid } & =\text { Water } \\
\mathrm{m}_{\mathrm{c}} & =10500 \mathrm{~kg} / \mathrm{hr} \\
& =10500 / 3600=2.917 \mathrm{~kg} / \mathrm{s}
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{T}_{\mathrm{h} 1} & =200 \circ \mathrm{C} \\
\mathrm{~T}_{\mathrm{h} 2} & =130 \circ \mathrm{C} \\
\mathrm{~T}_{\mathrm{c} 1} & =30 \circ \mathrm{C} \\
\mathrm{~T}_{\mathrm{c} 2} & =80 \cong \mathrm{C} \\
\mathrm{U} & =814 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
\mathrm{C}_{\mathrm{pc}} & =4187 \mathrm{~J} / \mathrm{kgK}
\end{aligned}
$$

To find :
\% of increase in area if the fluid flows were in parallel

Solution:

Heat gain by the hot fluid

$$
\begin{aligned}
Q \quad & =m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
& =2.917 \times 4187 \times(80-30) \\
& =610670 \mathrm{~W}
\end{aligned}
$$

$$
\text { For counter Flow, } \theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 2}\right)-\left(T_{h 2}-T_{c 1}\right)}{\ln \left(\frac{T_{h 1}-T_{c 2}}{T_{h 2}-T_{c 1}}\right)}
$$

$$
\theta_{m}=\frac{(200-80)-(130-30)}{\ln \left(\frac{200-80}{130-30}\right)}
$$

$$
\theta_{\mathrm{m}}=109.7^{\circ} \mathrm{C} \mathrm{C}
$$

Heat transfer rate

$$
\mathrm{Q}=\mathrm{UA}_{1} \theta_{\mathrm{m}}
$$

$$
\begin{aligned}
& \mathrm{A}_{1}=\frac{Q}{U \theta_{m}} \\
& \mathrm{~A}_{1}=\frac{610670}{814 \times 109.7} \\
& \mathrm{~A}_{1}=6.8 \mathrm{~m}^{2}
\end{aligned}
$$

For parallel flow :

$$
\theta_{\mathrm{m}}=\frac{\left(T_{h 1}-T_{c 1}\right)-\left(T_{h 2}-T_{c 2}\right)}{\ln \left(\frac{T_{h 1}-T_{c 1}}{T_{h 2}-T_{c 2}}\right)}
$$

$$
\theta_{\mathrm{m}}=\frac{(200-30)-(130-80)}{\ln \left(\frac{200-30}{130-80}\right)}
$$

$$
\theta_{\mathrm{m}}=98.05 \cong \mathrm{C}
$$

Heat transfer rate

$$
\mathrm{Q}=U \mathrm{~A}_{1} \theta_{\mathrm{m}}
$$

$$
\mathrm{A}_{2}=\frac{Q}{U \theta_{m}}
$$

$$
A_{2}=\frac{610670}{814 \times 98.05}
$$

$$
\mathrm{A}_{2}=7.65 \mathrm{~m}^{2}
$$

$\%$ of increase in area $=\frac{A_{2}-A_{1}}{A_{2}} \times 100$

$$
=\frac{7.65-6.8}{7.65} \times 100
$$

$$
\text { = } 11.11 \text { \% }
$$

Result :
\% of increase in area = 11.11\%
9. Determine the overall heat transfer coefficient $U_{0}$ based on the outer surface of a 2.54 cm O.D 2.286 cm I.D. heat exchanger tube ( $\mathrm{K}=102 \mathrm{~W} / \mathrm{mK}$ ). If the heat transfer co-efficients at the inside and out side of the tube are $h_{i}=5500 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$ and $h_{o}=3800 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$ respectively and the fouling factors are $\mathrm{R}_{\mathrm{fo}}=\mathrm{R}_{\mathrm{fi}}=0.0002 \mathrm{~m}^{2} \mathrm{WK}$.

Given :

$$
\begin{aligned}
& r_{1}=\frac{2.286}{2}=1.143 \mathrm{~cm}=1.143 \times 10^{-2} \mathrm{~m} \\
& r_{2}=\frac{2.54}{2}=1.27 \mathrm{~cm}=1.27 \times 10^{-2} \mathrm{~m} \\
& \mathrm{~h}_{\mathrm{o}}=3800 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
& \mathrm{~h}_{\mathrm{i}}=5500 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
& \mathrm{R}_{\mathrm{fo}}=\mathrm{R}_{\mathrm{fi}}=0.0002 \mathrm{~m}^{2} \mathrm{WK} \\
& \mathrm{~K}=102 \mathrm{~W} / \mathrm{mK}
\end{aligned}
$$

To find

Overall heat transfer co-efficient

Solution:

Over all heat transfer co-efficient based on outer surface

$$
\begin{aligned}
& \mathrm{U}_{0}=\frac{1}{\frac{1}{h_{i}}\left(\frac{r_{0}}{r_{i}}\right)+\frac{r_{0}}{r_{i}} R_{f i}+\frac{r_{0}}{K} \ln \left(\frac{r_{o}}{r_{i}}\right)+R_{f 0}+\frac{1}{h_{o}}} \\
&= \\
& \frac{1}{5500}\left(\frac{1.27 \times 10^{-2}}{1.143 \times 10^{-2}}\right)+\frac{1.27 \times 10^{-2}}{1.143 \times 10^{-2}}(0.0002)+\frac{1.27 \times 10^{-2}}{102} \ln \left(\frac{1.27 \times 10^{-2}}{1.143 \times 10^{-2}}\right)+0.0002+\frac{1}{3800} \\
&=1110.47 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
\end{aligned}
$$

Result :

$$
\text { Overall heat transfer coefficient } U_{0}=1110.47 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
$$

10. Steam enters a counter flow heat exchanger dry saturated at 10 bar and leaves at $350{ }^{\circ} \mathrm{C}$. The mass flow of steam is $800 \mathrm{~kg} / \mathrm{min}$. the gas enters the heat exchanger at $650{ }^{\circ} \mathrm{C}$ and mass flow rate is $1350 \mathrm{~kg} / \mathrm{min}$. if the tubes are 30 mm diameter and 3 m long. Determine the number of tubes required. Neglect the resistance offered by metallic tubes use following data

For steam: Tsat $=180{ }^{\circ} \mathrm{C}$ (at 10 bar)

$$
\mathrm{C}_{\mathrm{ps}}=2.71 \mathrm{~kJ} / \mathrm{kgK},
$$

$$
\mathrm{h}_{\mathrm{s}}=600 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
$$

For Gas : $\quad C_{p g}=1 \mathrm{~kJ} / \mathrm{kgK}$

$$
\mathrm{h}_{\mathrm{g}}=250 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
$$

Given :

$$
\begin{aligned}
\text { Hot fluid } & =\text { Gas } \\
\text { Cold fluid } & =\text { Steam } \\
m_{c} & =800 \mathrm{~kg} / \mathrm{min} \\
& =800 / 60=13.33 \mathrm{~kg} / \mathrm{s}
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{m}_{\mathrm{h}} & =1350 \mathrm{~kg} / \mathrm{min} \\
& =1350 / 60=22.5 \mathrm{~kg} / \mathrm{s} \\
\mathrm{~T}_{\mathrm{h} 1} & =650 \bigcirc \mathrm{C} \\
\mathrm{~T}_{\mathrm{c} 1} & =180 \bigcirc \mathrm{O} \text { (at } 10 \text { bar, take saturation temperature from steam table) } \\
\mathrm{T}_{\mathrm{c} 2} & =350 \bigcirc \mathrm{O} \\
\mathrm{C}_{\mathrm{pc}} & =2.71 \mathrm{~kJ} / \mathrm{kgK}=2710 \mathrm{~J} / \mathrm{kgK} \\
\mathrm{C}_{\mathrm{ph}} & =1 \mathrm{~kJ} / \mathrm{kgK}=1000 \mathrm{~J} / \mathrm{kgK} \\
\mathrm{~h}_{0} & =600 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K} \\
\mathrm{~h}_{\mathrm{i}} & =250 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
\end{aligned}
$$

To find :
No of tubes required

Solution:

Heat gain by the hot fluid

$$
\begin{aligned}
Q & =m_{c} C_{p c}\left(T_{c 2}-T_{c 1}\right) \\
& =13.33 \times 2710 \times(350-180) \\
& =6141131 \mathrm{~W}
\end{aligned}
$$

Heat lost by the hot fluid = Heat gain by the cold fluid

$$
\begin{aligned}
Q & =m_{h} C_{p h}\left(T_{h 1}-T_{h 2}\right) \\
6141131 & =22.5 \times 1000 \times\left(650-T_{h 2}\right) \\
T_{h 2} & =650-\frac{6141131}{22.5 \times 1000}
\end{aligned}
$$

$$
\mathrm{T}_{\mathrm{c} 2}=377{ }^{\circ} \mathrm{C}
$$

$$
\text { For counter Flow, } \begin{aligned}
\theta_{\mathrm{m}} & =\frac{\left(T_{h 1}-T_{c 2}\right)-\left(T_{h 2}-T_{c 1}\right)}{\ln \left(\frac{T_{h 1}-T_{c 2}}{T_{h 2}-T_{c 1}}\right)} \\
\theta_{\mathrm{m}} & =\frac{(650-350)-(377-180)}{\ln \left(\frac{650-350}{377-180}\right)}
\end{aligned}
$$

$$
\theta_{\mathrm{m}}=245{ }^{\circ} \mathrm{C}
$$

Overall heat transfer coefficient
$\mathrm{U}_{0}=\frac{1}{\frac{1}{h_{i}}+\frac{1}{h_{o}}}$
$U_{0}=\frac{1}{\frac{1}{600}+\frac{1}{250}}$
$\mathrm{U}_{0}=176.47 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$

Result :

## VI: RADIATION

## Introduction

Radiation heat transfer is defined as the transfer of energy across a system boundary by means of an electromagnetic mechanism which is caused solely by a temperature difference. Radiation heat transfer does not require a medium.

## Application:-

(i). In furnaces, combustion chambers, nuclear explosion and in space applications.
(ii). Solar energy incident upon the earth.

## Surface Emission Properties

The rate of emission of radiation by a body depends upon the following factors:
(i). The temperature of the surface
(ii). The nature of the surface and
(iii). The wavelength or frequency of radiation.

Total emissive power ( $\mathrm{E}_{\mathrm{b}}$ ):
The emissive power is defined as the total amount of radiation emitted by a body per unit area and unit time.

## Monochromatic emissive power ( $\mathrm{E}_{\lambda}$ )

At any Given Data temperature the amount of radiation emitted per unit wave length varies at different wavelength. It is defined as the rate of energy radiated per unit area of the surface per unit wavelength.

## Emissivity:-

It is defined as the ability of the surface of a body to radiate heat. It is also defined as the ratio of the emissive power of any body to the emissive power of a block body of equal temperature.

$$
\epsilon=\frac{E}{E_{b}}
$$

Its value ranging from 0 to 1

| For a black body | $\epsilon=1$ |
| :--- | :--- |
| For a white body | $\epsilon=0$ |
| For a gray body | $\epsilon=0$ to 1 |

## Absorptivity ( $\alpha$ ) :-

It is defined as the ratio of the radiation absorbed to the incident radiation

$$
\alpha=\frac{\text { radiation absorbed }}{\text { incident radiation }}
$$

Reflectivity ( $\rho$ ):-
It is defined as the ratio of the radiation reflected to the incident radiation.

$$
\rho=\frac{\text { radiation reflected }\left(Q_{r}\right)}{\text { Incident radiation }(Q)}
$$

Transmissivity ( $\tau$ ) :-
It is defined as the ratio of the radiation transmitted to the incident.

$$
\tau=\frac{\text { radiation transmitted }\left(Q_{t}\right)}{\text { Incident radiation }(Q)}
$$

Transmitted
radiation $\left(Q_{t}\right)$

By the conservation of energy principle

$$
Q_{a}+Q_{r}+Q_{t}=Q
$$

Dividing both sides by Q , we get

For black body: - $\quad \alpha=1, \rho=0, \tau=0$
(i.e.) a black body is one which neither reflects nor transmits any part of the incident radiation but absorbs all of it. In practice, a perfect black body $(\alpha=1)$ does not exists

For opaque body:-
When no incident radiation is transmitted through the body it is called an opaque body.
$\tau=0$
$\therefore \alpha+\rho=1$

Example: gasses and liquids.

White body:-
If all the incident radiation falling on the body are reflected it is called a "white body".
For a white body, $\rho=1, \alpha=0, \tau=0$

Example: gasses such as hydrogen, oxygen nitrogen.

Gray body:-
A gray body is defined as one whose absorptive of surface does not vary with temperature and wavelength of the incident radiation ( $\alpha=\alpha_{\lambda}=$ constant)

Concept of a black body:-
A black body has the following properties:-
(i). It absorbs all the incident radiation falling on it and does not transmit (or) reflect regardless of wave length and direction
(ii). It emits maximum amount of thermal radiation at all wavelength at any specified temperature.
(iii). It is a perfect emitter (i.e. the radiation emitted by a black body is independent of direction).

## The STEFAN BOLTZMANN LAW:-

The law states that the emissive power of a black body is directly proportional to the fourth power of its absolute temperature.
(i.e.)

$$
\begin{aligned}
& \qquad E_{b}=\sigma \mathrm{T}^{4} \\
& \mathrm{E}_{\mathrm{b}}=\text { Emissive power of a black body } \\
& \sigma=\text { Stefan Boltzmann constant }=5.67 \times 10^{-8} \mathrm{~W} / \mathrm{m}^{2} \mathrm{k}^{4} \\
& \mathrm{~T}=\text { absolute temperature } .
\end{aligned}
$$

Plank's law:-
The monochromatic distribution of the radiation intensity of a black body is Given Data by

$$
\begin{aligned}
\left(E_{\lambda}\right)_{b}= & \frac{C_{1} \lambda^{-5}}{\left(C_{2} /{ }_{\lambda T}\right)-1} \\
& \quad e^{\left(E_{\lambda}\right)_{b} \quad=\text { Monochromatic emissive power } \mathrm{w} / \mathrm{m}^{2}}
\end{aligned}
$$

$\mathrm{C}_{1} \quad=3.742 \times 10^{8} \mu \mathrm{wm}^{2}$

```
C2 = 1.4388 x 104 \mumk
```

Wien's Displacement law:-
A relationship between the temperature of a black body and the wave length at which the maximum valve of monochromatic emissive power, occurs.

Wien's displacement law states that the product of $\lambda_{\max }$ and $T$ is constant,
(i.e.)

$$
\begin{aligned}
& \lambda_{\max } \mathrm{T}=\text { constant } \\
& \lambda_{\max } \mathrm{T}=2898 \mu \mathrm{mk}
\end{aligned}
$$

Another form of wien's law,

$$
\begin{aligned}
\frac{\mathrm{E}_{b} \lambda_{\max }}{\mathrm{T}^{5}} & =\text { constant (or) } \quad \mathrm{E}_{b} \lambda_{\max }=\mathrm{C}_{4} \mathrm{~T}^{5} \\
\mathrm{C}_{4} & =1.307 \times 10^{-5} \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}^{5}
\end{aligned}
$$

Krichoff's law:-
The law states that at any temperature the ratio of total emissive power E to the total absorptivity $\alpha$ is a constant for all substance which are in thermal equilibrium with their environment.

Kirchoff's law also states that the emissivity of a body is equal to its absorptivity when the body remains in thermal equilibrium with its surroundings

$$
\epsilon=\alpha
$$

Intensity of radiation:- (I)
The intensity of radiation (I) is defined as the rate of energy leaving a surface in a Given Data direction per unit solid angle per unit area of the emitting surface normal to the mean direction in space.

The total emissive power of a diffuser surface is equal to $\pi$ times its intensity of radiation.

$$
E=\pi l
$$

## Lambert's cosine law:-

The law states that the total emissive power ( $\mathrm{E}_{\mathrm{b}}$ ) form a radiating plane surface in any direction is directly proportional to the cosine of the angle of emission

$$
\begin{gathered}
\mathrm{E}_{\mathrm{b}} \alpha \cos \theta \\
\mathrm{E}_{\mathrm{b}}=\mathrm{E}_{\mathrm{n}} \cos \theta
\end{gathered}
$$

## Problems

1) The effective temperature of a body having an area of $0.12 \mathrm{~m}^{2}$ is $527^{\circ} \mathrm{C}$. calculate the following.
(i). The total rate of energy emission.
(ii). The intensity of normal radiation, and
(iii). The wavelength of maximum monochromatic emissive power.

Given Data:-

$$
\begin{aligned}
& A=0.12 \mathrm{~m}^{2} \\
& T=527 \circ \mathrm{C}+273=800 \mathrm{~K}
\end{aligned}
$$

To find :-
(i). The total rate of energy emission.( $\mathrm{E}_{\mathrm{b}}$ )
(ii). The intensity of normal radiation, and (Ibn)
(iii). The wavelength of maximum monochromatic emissive power. $\left(\lambda_{\max }\right)$

Soln.:-
(i). $E_{b}=\sigma A T^{4}$

$$
=5.67 \times 10^{-8} \times 0.12 \times 800^{4}
$$

$$
=2786.9 \mathrm{~W}
$$

(ii). $\operatorname{Ibn}=\underline{E_{b}}$

$$
=\sigma T^{4}=7392.5^{\mathrm{W}} / \mathrm{m}^{2} \mathrm{sr}
$$

$\pi$
(iii). $\lambda_{\text {max }}$, from wien's displacement Law.

$$
\lambda_{\max }=2898 \mu \mathrm{mk}
$$

$$
\lambda_{\max }=2898
$$

## 800

$$
=3.622 \mu \mathrm{~m}
$$

2) Assuming the sun to be a black body emitting radiation with maximum intensity at $\lambda=0.49 \mu \mathrm{~m}$, calculate the following.
(i). The surface temperature of the sun and.
(ii). The heat flux at surface of the sun.

Given Data:-
$\lambda_{\max }=0.49 \mu \mathrm{~m}$.

To find:-
(i). The surface temperature of the sun and.
(ii). The heat flux at surface of the sun.

Soln.:-
(i). The surface temperature of the sun $(T)$ :

$$
\lambda_{\max } \mathrm{T}=2898 \mu \mathrm{mk} .
$$

$$
T=2898
$$

$\lambda_{\text {max }}$

$$
=\frac{2898}{0.49}
$$

$$
=5914 \mathrm{k}
$$

(ii). The heat flux at surface of the sun $(E)_{\text {sun }}$ :
$(E)_{\text {sun }}=\sigma T^{4}$

$$
=5.67 \times 10^{-8} \times(5914)^{4}
$$

$(E)_{\text {sun }}=6.936 \times 10^{7} \mathrm{~W} / \mathrm{m}^{2}$
3) Calculate the following for an industrial furnace in the form of a black body and emitting radiation at $2500^{\circ} \mathrm{C}$.
(i). Monochromatic emissive power at $1.2 \mu \mathrm{~m}$ length.
(ii). Wavelength at which the emission is maximum
(iii). Maximum emissive power,
(iv). Total emissive power,
(v). Total emissive power of the furnace if it is assumed as a real surface with emissivity equal to 0.9.

Give Data:-

$$
\begin{array}{ll}
\mathrm{T} & =2500+273=2773 \mathrm{k} \\
\lambda & =1.2 \mu \mathrm{~m} \\
\epsilon & =0.9
\end{array}
$$

To find:-
(i). Monochromatic emissive power at $1.2 \mu \mathrm{~m}$ length.
(ii). Wavelength at which the emission is maximum
(iii). Maximum emissive power,
(iv). Total emissive power,
(v). Total emissive power of the furnace if it is assumed as a real surface with emissivity equal to 0.9.

Soln.:
(i). Monochromatic emissive power at $1.2 \mu \mathrm{~m}$ length $\left(E_{\lambda}\right)_{\mathrm{b}}$ :

According to plank's law.

$$
\mathrm{C}_{1}=3.742 \times 10^{2} \mathrm{~W} / \mathrm{m}^{2}
$$

$\left(E_{\lambda}\right)_{b}=C_{1} \lambda^{-5}$

$$
e^{\left(C_{2} / \lambda T\right)}-1
$$

$=\quad\left(3.742 \times 10^{2}\right)\left(1.2 \times 10^{-6}\right)^{-5}$

$$
e\left(1.4388 \times 10^{-2} / 2773 \times 1.2 \times 10^{-6}\right)-1
$$

$=\underline{1.5038 \times 10^{38}}$

### 74.4776

$$
\left(E_{\lambda}\right)_{b}=2.014 \times 10^{12} \mathrm{~W} / \mathrm{m}^{2}
$$

(ii). Wavelength at which the emission is maximum ( $\lambda_{\text {max }}$ )

According to Wien's displacement Law.

$$
\begin{array}{cc}
\lambda_{\max }=\frac{2898}{T} & =\underline{2898}=1.045 \mu \mathrm{~m} \\
\mathrm{~T} & 2773
\end{array}
$$

(iii). Maximum emissive power $\left(E_{\lambda}\right)_{b \text { max }}$

$$
\left(E_{\lambda}\right)_{b \max }=1.285 \times 10^{-5} \mathrm{~T}^{5}
$$

$$
=1.285 \times 10^{-5} \times(2773)^{5}
$$

$$
=2.1 \times 10^{12} \mathrm{~W} / \mathrm{m}^{2} \text { per } m \text { length }
$$

(iv). Total emissive power ( $\mathrm{E}_{\mathrm{b}}$ )

$$
\begin{aligned}
\mathrm{E}_{\mathrm{b}} \quad & =\sigma \mathrm{T}^{4} \\
& =5.67 \times 10^{-8}(2773)^{4} \\
& =3.352 \times 10^{6} \mathrm{~W} / \mathrm{m}^{2}
\end{aligned}
$$

(v). Total emissive power (E with emissivity $(\epsilon)=0.9$

$$
\begin{aligned}
E & =\epsilon \sigma T^{4} \\
& =0.9 \times 5.67 \times 10^{-8} \times 2773^{4}
\end{aligned}
$$

$$
=3.017 \times 10^{6} \mathrm{~W} / \mathrm{m}^{2}
$$

4) Assuming the sun (diameter $=1.4 \times 10^{9} \mathrm{~m}$ ) as a black body having a surface temperature of 5750k and at a mean distance of $15 \times 10^{10} \mathrm{~m}$ from the earth (diameter $=12.8 \times 10^{6} \mathrm{~m}$ ) estimate the following.
(i). The total energy emitted by the sun.
(ii). The emission received per $\mathrm{m}^{2}$ just outside the atmosphere of the earth.
(iii). The total energy received by the earth if no radiation is blocked by the atmosphere of the earth and,
(iv). The energy received by a $1.6 \mathrm{~m} \times 1.6 \mathrm{~m}$ solar collector whose normal is inclined at $50^{\circ} \mathrm{C}$ to the sun. the energy loss through the atmosphere is $42 \%$ and diffuse radiation is $22 \%$ of direct radiation :-

## Given Data:-

earth

Radius of the earth $\mathrm{r}_{\mathrm{e}}=12.8 \times 10^{6} / 2=6.4 \times 10^{6} \mathrm{~m}$
Surface temp. of the

$$
\text { sun } \mathrm{T}=5750 \mathrm{k}
$$

To find:-
(i). The total energy emitted by the sun
(ii). The emission received per $\mathrm{m}^{2}$
(iii). The total energy received by the earth
(iv). The energy received by the solar collector.

Soln.:-
(i). The total energy emitted by the sun:

$$
\begin{aligned}
E_{b} \quad & =\sigma A T^{4} \\
& =5.67 \times 10-8 \times 4 \pi r_{s}^{2} \times(5750)^{4} \\
& =5.67 \times 10^{-8} \times 4 \pi \times\left(0.7 \times 10^{9}\right)^{2} \times(5750)^{4} \\
& =3.816 \times 10^{26} \mathrm{w} .
\end{aligned}
$$

(ii). The emission received per $\mathrm{m}^{2}$

$$
\mathrm{E}_{\mathrm{b}} \quad=3.816 \times 10^{26}
$$

$$
A \quad 4 \pi R^{2}

$$

5) A black body is kept at a temperature of $727^{\circ} \mathrm{C}$. Estimate the fraction of the thermal radiation emitted by the surface in the wavelength band 1 and $5 \mu$

Given Data:-

$$
727^{\circ} \mathrm{C}+273=1000 \mathrm{~K}
$$

$\lambda_{1}=1 \mu$
$\lambda_{2}=5 \mu$

To find:-

The fraction of thermal radiation.

Solution:-

$$
\begin{aligned}
& \lambda_{1} T=1 \times 1000=1000 \mu \mathrm{k} \\
& \lambda_{2} T=5 \times 1000=5000 \mu \mathrm{k}
\end{aligned}
$$

[From table HMT data book pg]

$$
\begin{aligned}
& \text { corresponding } 1000 \mu \mathrm{k} \\
& \begin{aligned}
& \mathrm{F}_{\mathrm{o}}-\lambda_{1} T \quad=\underline{\mathrm{E}_{\mathrm{bo}}-\lambda_{1} T} \\
& \sigma T^{4} \\
&=0.3 \times 10^{-3} \\
&=0.0003 .
\end{aligned}
\end{aligned}
$$

Corresponding to $5500 \mu k$,

$$
\mathrm{F}_{\mathrm{o}}-\lambda_{2} T=\mathrm{E}_{\mathrm{bo}}-\lambda_{2} T
$$

    \(\sigma T^{4}\)
    \(=0.6337\)
        \(\sigma T^{4}=\left(5067 \times 10^{-8}\right)(10000)^{4}\)
            \(=56.7 \mathrm{kw} / \mathrm{m}^{2}\)
            \(F \lambda_{1} T-\lambda_{2} T=\left(F_{0}-\lambda_{2} T\right)-\left(F_{0}-\lambda_{1} T\right)\)
            \(=0.6337-0.0003\)
    $$
=0.6334
$$

$$
\mathrm{E}_{\mathrm{b}}\left(\lambda_{1}-\lambda_{2}\right)=0.6334 \times 56.7
$$

$$
=35.9 \mathrm{kw} / \mathrm{m}^{2}
$$

6) It is observed that the intensity of the radiation emitted by the sun is maximum at a wavelength of $0.5 \mu$. Assuming the sun to be a black body, estimate the surface temperature and emissive power.

Given Data:-

$$
\lambda=0.5 \mu
$$

To find
(i). Temperature of surface
(ii). Emissive power

Solution

According to Wien's Displacement law

$$
\lambda_{\max } T=0.289 \times 10^{-2} \mathrm{mk}
$$

$$
\mathrm{T}=\frac{0.289 \times 10^{-2}}{\lambda_{\max }}
$$

$$
\mathrm{T}=0.289 \times 10^{-2}
$$

$$
0.5 \times 10^{-6}
$$

Using Stefan Boltzman law

$$
\begin{aligned}
& \left(E_{b}\right)_{\text {sun }}=\sigma T^{4} \\
& =5.67 \times 10^{-8} \times(5780)^{4} \\
& =63.3 \mathrm{Mw} / \mathrm{m}^{2}
\end{aligned}
$$

7) A Gray surface is maintained at a temperature of $827^{\circ} \mathrm{C}$. If the maximum spectral emissive power at a temperature is $1.37 \times 10^{10} \mathrm{~W} / \mathrm{m} 3$ determine the emissivity of the body and the wavelength corresponding to the maximum spectral intensity of radiation.

Given Data:-

$$
\begin{aligned}
& \mathrm{T}=827^{\circ} \mathrm{C}+273=1100 \mathrm{~K} \\
& \mathrm{E}_{\lambda \max }=1.37 \times 10^{10} \mathrm{~W} / \mathrm{m}^{3}
\end{aligned}
$$

To find

Soln.:-
(i) Emissivity
(ii)
$\lambda_{\text {max }}$
According to Wein's law,
(i) Emissivity
$\lambda_{\text {max }}$
(ii)
According to Wein's law,

```
            Eb }\mp@subsup{\lambda}{\mathrm{ max }}{
                    = 1.307 X 10-5
                T5
Eb \lambdamax =1.307 X 10-5 X (1100) 5
    =2.1 X 1010 W/m
```

```
    Eb}\mp@subsup{\lambda}{\mathrm{ max }}{
```

$$
\begin{aligned}
& =\frac{1.37 \times 10^{10}}{2.1 \times 10^{10}} \\
& =0.65
\end{aligned}
$$

According to Wein law

$$
\lambda_{\max }=0.289 \times 10^{-2}
$$

$$
=2.627 \mu
$$

Result:-
(i) $\mathrm{E}=0.65$
(ii) $\quad \lambda_{\text {max }}=2.67 \mu$
8) A Pyrometer records the temperature of the body as $1400^{\circ} \mathrm{C}$ with a red light filter $(\lambda=0.65 \mu)$. Find the true temperature of the body .If it emissivity at $0.65 \mu$ is 0.6 .

Given Data:-

$$
\begin{aligned}
& T=1400^{\circ} \mathrm{C} \\
& \lambda=0.65 \mu
\end{aligned}
$$

$$
E=0.6
$$

To find:-
True temperature of the body
Soln.:-

According to the plank's law

$$
\begin{aligned}
& \left(E_{\lambda}\right)_{b}=\frac{C_{1} \lambda^{-5}}{e^{\left(C_{2} / \lambda T_{b}\right)}-1}
\end{aligned}
$$

For gray body

$$
\begin{aligned}
\left(E_{\lambda}\right)_{b}= & \frac{c_{1} E_{\lambda} \lambda^{-5}}{e^{\left(c_{2} / \lambda T\right)}-1}
\end{aligned}
$$

| $\frac{C_{1} \lambda^{-5}}{e^{\left(C_{2} / \lambda T_{b}\right)}-1}$ | $\frac{C_{1} \in \lambda^{-5}}{e^{\left(C_{2} / \lambda T\right)}-1}$ |
| :--- | :--- |

$$
\begin{aligned}
& \frac{C_{1} \lambda^{-5}}{e^{\left(C_{2} / \lambda T_{b}\right)}-1} \quad \frac{C_{1} \lambda^{-5}}{\epsilon_{\lambda}}\left[e^{\left(C_{2} / \lambda T\right)}-1\right]
\end{aligned}
$$

$$
\begin{aligned}
e^{\left(C_{2} / \lambda T_{b}\right)}-1 & =\frac{1}{1}\left[e^{\left(C_{2} / \lambda T\right)}-1\right] \\
\epsilon_{\lambda}\left[e^{\left(C_{2} / \lambda T_{b}\right)}-1\right] & =e^{\left(C_{2} / \lambda T\right)}-1 \\
\epsilon_{\lambda}\left[e^{\left(C_{2} / \lambda T_{b}\right)}-1\right]+1 & =e^{\left(C_{2} / \lambda T\right)} \\
\ln \left[\epsilon_{\lambda}\left(e^{\left(C_{2} / \lambda T_{b}\right)}-1\right)+1\right]= & C_{2} / \lambda T \\
\ln \epsilon_{\lambda}+\ln e^{\left(C_{2} / \lambda T_{b}\right)}-\ln (1)+\ln (1) & =
\end{aligned}
$$

$$
C_{2} / \lambda T=C_{2} / \lambda T_{\mathrm{b}}+\ln \epsilon_{\lambda}
$$

$$
1 / T \quad=\quad 1 / T_{b}+\lambda / C_{2} \ln \epsilon_{\lambda}
$$

$$
T \quad \frac{1}{1 / T_{b}+\lambda / c_{2} \ln \epsilon_{\lambda}}
$$

T

$$
1 / 1673+\left[0.65 \times 10^{-6} / 1.439 \times 10^{-2} \ln (0.6)\right]
$$

$$
=1740 \mathrm{~K}
$$

$$
=14670 \mathrm{C}
$$

Result:

The temperature of the body $=1467^{\circ} \mathrm{C}$
9) A metallic bar at $37{ }^{\circ} \mathrm{C}$ is placed inside an oven whose interior is maintained at a temperature of 1100 K the absorptivity of the bar (at $37 \circ \mathrm{C}$ ) a function of the temperature of incident radiation and a few representative values are Given Data below.

| Temp (k) | 310 | 700 | 1100 |
| :---: | :---: | :---: | :---: |
| $\alpha$ | 0.8 | 0.68 | 0.52 |

Estimate the rate of absorption and emission by the metallic bar.

Given Data:-

$$
\begin{aligned}
\text { Temp of metallic bar } & =37{ }^{\circ} \mathrm{C} \\
\text { Temp at oven } & =1100 \mathrm{~K} \\
\alpha \text { (at } 1100 \mathrm{~K}) & =0.52 \\
\alpha(\text { at } 310 \mathrm{~K}) & =0.8
\end{aligned}
$$

To find:-
(i) rate of absorption
(ii) rate of emission

Soln.:-
(i). Rate of absorption
(ii).
$\mathrm{Q}_{\mathrm{a}}=\alpha . \sigma \mathrm{T}^{4}$

$$
=0.52 \times\left(5.67 \times 10^{-8}\right) 1100^{4}
$$

$$
=43.15 \mathrm{k} \mathrm{~W} / \mathrm{m}^{2}
$$

(iii). Rate of emission
(iv).
$\mathrm{Q}_{\mathrm{e}} \quad=\mathrm{E} \sigma \mathrm{T}^{4}$

According to Kirchoff's law

$$
\begin{aligned}
& \epsilon=\alpha \\
& \epsilon=0.8\left(\text { at } 37^{\circ} \mathrm{C}\right) \text { or } 310 \mathrm{~K}
\end{aligned}
$$

Qe $=E \sigma T^{4}$

$$
=0.8 \times 5.67 \times 10^{-8} \times(310)^{4}
$$

$$
=418.9^{\mathrm{W}} / \mathrm{m}^{2}
$$

## Radiation exchange between Surfaces:

The radiation heat transfer between different types of surfaces both in non participating and participating media and the following assumptions made.
(i) All surfaces have uniform properties over their whole extent
(ii) Each surface is considered to be either gray or black.
(iii) The absorptivity of surface is independent of the temperature of the source of the incident radiation and equals is emissivity and
(iv) Radiation and reflection process is diffuse.

## Radiation exchange between two black bodies separated by a non absorbing medium:

Lets us consider heat exchange between elementary between $\mathrm{dA}_{1}$ and $\mathrm{dA}_{2}$ of two black radiating bodies, separated by a non absorbing medium, and having area $A_{1}$ and $A_{2}$ and temperature $T_{1}$ and $T_{2}$ respectively.

The elementary areas at a distances $r$ apart and the normal to these areas make angles $\theta_{1}$ and $\theta_{2}$ with the line joining them.

Projected area $\mathrm{dA}_{1} \cos \theta$.
Energy leaving $\mathrm{dA}_{1}$ in direction $\theta_{1}$
$=I_{n 1} \mathrm{dA}_{1} \cos \theta_{1}$
$\mathrm{In}_{1}=$ Intensity of radiation at surface $\mathrm{A}_{1}$

$$
\mathrm{In}_{1}=\mathrm{E}_{\mathrm{b} 1}
$$

$\pi$

Let $\mathrm{d}_{\mathrm{w} 1}$ be subtended at $\mathrm{dA}_{1}$ by $\mathrm{dA}_{2}$, and $\mathrm{d}_{\mathrm{w} 2}$ subtended at $\mathrm{dA}_{2}$ by $\mathrm{dA}_{1}$,

So,

$$
\mathrm{d}_{\mathrm{w} 1}=\frac{\mathrm{dA} \mathrm{~A}_{2} \cos \theta_{2}}{\mathrm{r}^{2}}
$$

```
dw2}=d\mp@subsup{A}{1}{}\operatorname{cos}\mp@subsup{0}{1}{
```

$r^{2}$

The rate of radiant energy leaving $\mathrm{dA}_{1}$ and striking on $\mathrm{dA}_{2}$ is Given Data by,

$$
d Q_{1-2}=\ln _{1} d_{A_{1}} \cos \theta_{1} \times d_{w 1}
$$

$$
=\ln _{1} d_{A_{1}} \cos \theta_{1} \times d A_{2} \cos \theta_{2}
$$

$$
d Q_{1-2}=\ln _{1} \cos \theta_{1} \cos \theta_{2} d A_{1} d A_{2}
$$

$$
d Q_{2-1}=\ln _{2} d_{A 2} \cos \theta_{2} \times d_{w 2}
$$

$$
=\ln _{2} \mathrm{~d}_{\mathrm{A} 2} \cos \theta_{2} \times \mathrm{d} \mathrm{~A}_{1} \cos \theta_{1}
$$

$$
r^{2}
$$

$$
d Q_{2-1}=\ln _{1} \cos \theta_{1} \cos \theta_{2} d A_{1} d A_{2}
$$

$$
r^{2}
$$

$$
d Q_{1-2}=d Q_{1-2}-d Q_{2-1}
$$

$$
\mathrm{dQ}_{1-2}=\left(\mathrm{Eb}_{1}-\mathrm{Eb}_{2}\right) \cos \theta_{1} \cos \theta_{2} \mathrm{dA}_{1} \mathrm{dA}_{2}
$$

the net flow is the difference between the quantities

$$
Q_{1-2}=\left(E_{b 1}-E_{b 2}\right) \int_{A_{1}} \int_{A_{2}} \frac{\cos \theta_{1} \cos \theta_{2} d A_{1} d A_{2}}{\pi r^{2}}
$$

This is also equal to $\left(\mathrm{Eb}_{1}-\mathrm{Eb}_{2}\right) \mathrm{A}_{1} \mathrm{~F}_{12}$

## Shape factor relationships

As the shape factor values are available for limited geometric situations only, it becomes necessary to use some basic relationships between shape factors to evaluate the shape factor for other connected geometries. For example shape factor value are available for perpendicular surfaces with a common edge. But shape factor values for perpendicular surfaces will meet only if extended, is needed. The shape factor relationship together with the reciprocity theorem are used to evaluate shape of factor value in such situations.
Consider surfaces $A_{1}, A_{2}$ and $A_{3}$ shown in Fig. The first of such rules is

$$
\begin{gathered}
F_{1-2}=\frac{1}{A_{1}} \int_{A_{1}} \int_{A_{2}} \frac{\cos \theta_{1} \cos \theta_{2} d A_{1} d A_{2}}{\pi r^{2}} \\
F_{3-1}, 2=F_{3-1}+F_{3-2}
\end{gathered}
$$

This is an obvious relation as the energy reaching an area is the sum of energies reaching individual parts of the area. Generally

$$
\mathrm{Fi}-\mathrm{j}, \mathrm{k}, \mathrm{l}, \mathrm{~m}, \mathrm{n} . \ldots . .=\mathrm{Fi}-\mathrm{j}+\mathrm{Fi}-\mathrm{k}+\mathrm{Fi}-\mathrm{j}+\mathrm{Fi}-\mathrm{m}+\ldots .
$$

Multiplying the RHS and LHS of equation, by the area

$$
\text { A3F3-1, } 2=\text { A3F3-1 + A3F2-3 }
$$

Then using the reciprocity theorem,

$$
(\mathrm{A} 1+\mathrm{A} 2) \mathrm{F} 1,2-3=\mathrm{A} 1 \mathrm{~F} 1-3+\mathrm{A} 2 \mathrm{~F} 2-3
$$

## RADIANT HEAT EXCHANGE BETWEEN BLACK SURFACES

To determine radiant heat exchange between black surfaces

$$
\mathrm{Q} 1-2=\mathrm{A} 1 \mathrm{~F} 1-2(\mathrm{~Eb} 1-\mathrm{Eb} 2)
$$

This can be represented by electrical analogue shown in

The temperatures and geometric parameters should be specified for solution

## HEAT EXCHANGE BY RADIATION BETWEEN GRAY SURFACES

The calculation of heat exchange involves the summation of the energy absorbed on each incidence on the surface. Additional resistance to heat absoption is introduced by the emissivity/absorptivity of the surface. In order to simplify the process of calculation two new terms called "radiosity" and "irradiation" are introduced. Irradiation (G) is the total radiation incident upon a surface per unit time and unit area (W/m2).

This quantity consists of the radiation from other surfaces and the reflected radiation from other surfaces. Radiosity ( J ) is defined as the total radiation that leaves a surface per unit time and unit area ( $\mathbf{W} / \mathrm{m} 2$ ). This quantity consists of the emissive power of the surface and the reflections by the surface. From these definitions we get

$$
\begin{aligned}
& J=\varepsilon E_{b}+\rho G \\
& \rho=1-\alpha=1-\varepsilon \\
& J=\varepsilon E_{b}+(1-\varepsilon) G
\end{aligned}
$$

In the calculation of heat transfer between gray surfaces an important assumption is that radiosity and irradiation are uniform over the surface. Considering a heat balance over the surface, the net energy leaving the surface is the difference between radiosity and irradiation.

$$
Q / A_{1}=J_{1}-G_{1}
$$

After simplifying

$$
Q=\frac{\varepsilon_{1} A_{1}}{1-\varepsilon_{1}}\left(E_{b 1}-J_{1}\right)=\frac{E_{b 1}-J_{1}}{\left(1-\varepsilon_{1}\right) / A_{1} \varepsilon_{1}} \mathrm{~W}
$$

## Radiation Shields:

Any surface placed in between two surfaces introduces additional surface resistance reducing heat transfer. This is known as radiation shield and is extensively used in practice.

## UNIT - III

1. Two large plates are maintained at a temperature of 900 K and 500 K respectively. Each plate has area of $\mathbf{6}^{\mathbf{2}}$. Compare the net heat exchange between the plates for the following cases.
(i) Both plates are black
(ii) Plates have an emissivity of 0.5

## Given:

$$
\begin{aligned}
& \mathrm{T}_{1}=900 \mathrm{~K} \\
& \mathrm{~T}_{2}=500 \mathrm{~K} \\
& \mathrm{~A}=6 \mathrm{~m}^{2}
\end{aligned}
$$

## To find:

(i) $\quad\left(\mathrm{Q}_{12}\right)_{\text {net }}$ Both plates are black $\mathrm{C}=1$
(ii) $\quad\left(\mathrm{Q}_{12}\right)_{\text {net }} \quad$ Plates have an emissivity of $\mathrm{C}=0.5$

## Solution

$$
\text { Case (i) } \quad \epsilon_{1}=\epsilon_{2}=1
$$

$$
\begin{gathered}
\left(Q_{12}\right)_{n e t}=\frac{A \sigma\left(T_{1}^{4}-T_{2}^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{2}}-1} \\
\left(Q_{12}\right)_{n e t}=\frac{A \times 5.67\left[\left(\frac{T_{1}}{100}\right)^{4}-\left(\frac{T_{2}}{100}\right)^{4}\right]}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{2}}-1} \\
\left(Q_{12}\right)_{n e t}=\frac{6 \times 5.67\left[\left(\frac{900}{100}\right)^{4}-\left(\frac{500}{100}\right)^{4}\right]}{\frac{1}{1}+\frac{1}{1}-1} \\
\left(Q_{12}\right)_{n e t}=201.9 \times 10^{3} \mathrm{~W}
\end{gathered}
$$

Case (ii) $\quad \epsilon_{1}=\epsilon_{2}=0.5$

$$
\begin{gathered}
\left(Q_{12}\right)_{n e t}=\frac{A \sigma\left(T_{1}{ }^{4}-T_{2}^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{2}}-1} \\
\left(Q_{12}\right)_{n e t}=\frac{6 \times 5.67\left[\left(\frac{900}{100}\right)^{4}-\left(\frac{500}{100}\right)^{4}\right]}{\frac{1}{0.5}+\frac{1}{0.5}-1} \\
\left(Q_{12}\right)_{n e t}=67300 \mathrm{~W}
\end{gathered}
$$

2. The sun emits maximum radiation at $\lambda=0.52 \mu$. Assuming the sun to be a black body, calculate the surface temperature of the sun. Also calculate the monochromatic emissive power of the sun's surface.

## Given:

$$
\lambda_{\max }=0.52 \mu=0.52 \times 10^{-6} \mathrm{~m}
$$

## To find:

(i) Surface temperature, T.
(ii) Monochromatic emissive power, $\mathrm{E}_{\mathrm{b} \lambda}$
(iii) Total emissive power, E
(iv) Maximum emissive power, $\mathrm{E}_{\max }$

## Solution:

1. From Wien's law,

$$
\lambda_{\max } \mathrm{T}=2.9 \times 10^{-3} \mathrm{mK}
$$

[From HMT Data book, page no 82, sixth editions]

$$
\begin{gathered}
T=\frac{2.9 \times 10-3}{0.52 \times 10-6} \\
T=5576 \mathrm{~K}
\end{gathered}
$$

2. Monochromatic emissive power, ( $\mathrm{E}_{\mathrm{b} \mathrm{d}}$ )

From Planck's law,

$$
\mathrm{E}_{\mathrm{b} \lambda}=\frac{\mathrm{c}_{1} \lambda^{-5}}{\left[\mathrm{e}^{\left(\frac{c_{2}}{\lambda T}\right)}-1\right]}
$$

[From HMT Data book, page no 82, sixth editions]
Where

$$
\begin{aligned}
& c_{1}=0.374 \times 10^{-15} \mathrm{Wm}^{2} \\
& c_{2}=14.4 \times 10^{-3} \mathrm{mK} \\
& \begin{aligned}
& \lambda=0.52 \times 10^{-6} \mathrm{~m} \\
& \mathrm{~T}=5576 \mathrm{~K}
\end{aligned} \\
& \mathrm{E}_{\mathrm{b} \lambda}=\frac{0.374 \times 10^{-15}\left[0.52 \times 10^{-6}\right]^{-5}}{\left[\mathrm{e}^{\left(\frac{14.4 \times 10^{-3}}{0.52 \times 10^{-6} \times 5576}\right)}-1\right]} \\
& \mathrm{E}_{\mathrm{b} \lambda}=6.9 \times 10^{13} \mathrm{~W} / \mathrm{m}^{2}
\end{aligned}
$$

3. Total emissive power

$$
E=\sigma T^{4}=5.67 \times 10^{-6} \times(5576)^{4} \quad \mathrm{~W} / \mathrm{m}^{2}
$$

4. Maximum emissive power

$$
\mathrm{E}_{\max }=1.285 \times 10^{-5} \mathrm{~T}^{5}=1.285 \times 10^{-5}(5576)^{5} \mathrm{~W} / \mathrm{m}^{2}
$$

3. A 70 mm thick metal plate with a circular hole of 35 mm diameter along the thickness is maintained at a uniform temperature $250{ }^{\circ} \mathrm{C}$. Find the loss of energy to the surroundings at $27^{\circ}$, assuming the two ends of the hole to be as parallel discs and the metallic surfaces and surroundings have black body characteristics.

## Given:

$$
\begin{aligned}
& \quad r_{2}=\left(r_{3}\right)=\frac{35}{2}=17.5 \mathrm{~mm}=0.0175 \mathrm{~m} \\
& \mathrm{~L}=70 \mathrm{~mm}=0.07 \mathrm{~m} \\
& \mathrm{~T}_{1}=250+273=523 \mathrm{~K} \\
& \mathrm{~T}_{\text {surr }}=27+273=300 \mathrm{~K}
\end{aligned}
$$

Let suffix 1 designate the cavity and the suffices 2 and 3 denote the two ends of 35 mm dia. Hole which are behaving as discs. Thus,

$$
\begin{gathered}
\frac{L}{r_{2}}=\frac{0.07}{0.0175}=4 \\
\frac{r_{3}}{L}=\frac{0.0175}{0.07}=0.25
\end{gathered}
$$

The configuration factor, $\mathrm{F}_{2-3}$ is 0.065
Now,

$$
\mathrm{F}_{2-1}+\mathrm{F}_{2-2}+\mathrm{F}_{2-3}=1
$$

.......By summation rule
But,
$\mathrm{F}_{2-2}=0$

$$
F_{2-1}=1-F_{2-3}=1-0.065=0.935
$$

Also,

$$
\mathrm{A}_{1} \mathrm{~F}_{1-2}=\mathrm{A}_{2} \mathrm{~F}_{2-1}
$$

By reciprocating theorem

$$
F_{1-2}=\frac{A_{2} F_{2-1}}{A_{1}}=\frac{\pi \times(0.0175)^{2} \times 0.935}{\pi \times 0.035 \times 0.07}=0.1168
$$

$F_{1-3}=F_{1-2}=0.1168 \quad \ldots \ldots \ldots$. By symmetry

The total loss of energy = loss of heat by both ends

$$
\begin{gathered}
=\mathrm{A}_{1} \mathrm{~F}_{1-2} \sigma\left(\mathrm{~T}_{1}^{4}-\mathrm{T}_{\text {surr }}^{4}\right)+\mathrm{A}_{1} \mathrm{~F}_{1-3} \sigma\left(\mathrm{~T}_{1}^{4}-\mathrm{T}_{\text {surr }}^{4}\right) \\
\text { therefore }\left(\mathrm{F}_{1-2}=\mathrm{F}_{1-3}\right) \\
=2 \mathrm{~A}_{1} \mathrm{~F}_{1-2} \sigma\left(\mathrm{~T}_{1}^{4}-\mathrm{T}_{\text {surr }}^{4}\right) \\
=2(\pi \times 0.035 \times 0.07) \times 0.1168 \times 5.6\left[\left(\frac{523}{100}\right)^{4}-\left(\frac{300}{100}\right)^{4}\right]=6.8 \mathrm{~W}
\end{gathered}
$$

November 2011
4. The filament of a 75 W light bulb may be considered as a black body radiating into a black enclosure at $70^{0} C$. the filament diameter is 0.10 mm and length is $5 \mathbf{~ c m}$. considering the radiation, determine the filament temperature .

Given:

$$
\begin{aligned}
& \mathrm{Q}=75 \mathrm{~W}=75 \mathrm{~J} / \mathrm{s} \\
& \mathrm{~T}_{2}=70+273=343 \mathrm{~K} \\
& \mathrm{~d}=0.1 \mathrm{~mm} \\
& l=5 \mathrm{~cm} \\
& \text { Area }=\pi \mathrm{dl}
\end{aligned}
$$

## Solution:

$$
\begin{gathered}
\mathrm{C}=1 \text { for black body } \\
Q=\sigma \epsilon A\left(T_{1}{ }^{4}-T_{2}^{4}\right) \\
75=5.67 \times 10^{-8} \times 1 \times \pi \times 0.1 \times 10^{-3} \times 5 \times 10^{-2}\left(T_{1}{ }^{4}-(343)^{4}\right) \\
T_{1}{ }^{4}=\frac{75}{8.906 \times 10^{-13}}+(343)^{4} \\
T_{1}=3029 \mathrm{~K} \\
T_{1}=3029-273=2756^{0} \mathrm{C}
\end{gathered}
$$

## November 2011 (old regulation)

5. Two parallel plates of size 1.0 m by 1.0 m spaced 0.5 m apart are located in a very large room, the walls of which are maintained at a temperature of $27^{0} \mathbf{C}$. one pllate is maintained at a temperature of $900^{\circ} \mathrm{C}$ and other at $400^{\circ} \mathrm{C}$. their emissivities are 0.2 and 0.5 respectively. If the plates exchange heat between themselves and the surroundings, find the net heat transfer to each plate and to the room. Consider only the plate surface facing each other.
Given:
Three surfaces ( 2 plates and wall)

$$
\begin{gathered}
T_{1}=900^{\circ} \mathrm{C}=1173 \mathrm{~K} \\
T_{2}=400^{\circ} \mathrm{C}=673 \mathrm{~K} \\
T_{3}=27^{\circ} \mathrm{C}=300 \mathrm{~K} \\
A_{1}=A_{2}=1.0 \mathrm{~m}^{2} \\
\epsilon_{1}=0.2 \\
\epsilon_{2}=0.2
\end{gathered}
$$

Room size is much larger than the plate size

$$
\text { Surface resistance } \frac{1-\epsilon_{3}}{\epsilon_{3} A_{3}}=0 \text { and then } E_{b 3}=J_{3}
$$

1. To find the shape factor $F_{1-2}$.

Ratio of smaller side to distance between plane.

$$
=\frac{1}{0.5}=2
$$

Corresponding to 2 and curve 2 in HMT Data book

$$
F_{1-2}=0.4
$$

By summation rule

$$
\begin{aligned}
& \mathrm{F}_{1-2}+\mathrm{F}_{1-3}=1 \\
& \mathrm{~F}_{1-3}=1-\mathrm{F}_{1-2} \\
& \mathrm{~F}_{1-3}=1-0.4=0.6 \\
& \mathrm{~F}_{1-3}=0.6 \\
& \mathrm{~F}_{2-1}+\mathrm{F}_{2-3}=1 \\
& \mathrm{~F}_{2-3}=1-\mathrm{F}_{2-1} \\
& \mathrm{~F}_{2-3}=1-0.4 \\
& \mathrm{~F}_{2-3}=0.6
\end{aligned}
$$

The resistances are

$$
\begin{gathered}
R_{1}=\frac{1-\epsilon_{1}}{\epsilon_{1} A_{1}}=\frac{1-0.2}{0.2 \times 1}=4.0 \\
R_{2}=\frac{1-\epsilon_{2}}{\epsilon_{2} A_{2}}=\frac{1-0.5}{0.5 \times 1}=1.0 \\
R_{1-2}=\frac{1}{A_{1} F_{1-2}}=\frac{1}{1 \times 0.4}=1.0 \\
R_{1-3}=\frac{1}{A_{1} F_{1-3}}=\frac{1}{1 \times 0.6}=1.67 \\
R_{2-3}=\frac{1}{A_{2} F_{2-3}}=\frac{1}{1 \times 0.6}=1.67
\end{gathered}
$$

To find radiosities $J_{1} J_{2}$ and $J_{3}$, find total emissive power $\left(E_{b}\right)$

$$
\begin{aligned}
& E_{b 1}=\sigma T_{1}^{4}=5.67\left(\frac{1173}{100}\right)^{4}=107.4 \mathrm{~kW} / \mathrm{m}^{2} \\
& E_{b 2}=\sigma T_{2}^{4}=5.67\left(\frac{673}{100}\right)^{4}=11.7 \mathrm{~kW} / \mathrm{m}^{2} \\
& \qquad E_{b 3}=\sigma T_{3}^{4}=5.67\left(\frac{300}{100}\right)^{4}=0.46 \mathrm{~kW} / \mathrm{m}^{2}
\end{aligned}
$$

## Node $\mathbf{J}_{1}$ :

$\mathrm{J}_{1}$ in terms of $\mathrm{J}_{2}$

## Node $\mathbf{J}_{2}$

$$
\frac{J_{1}-J_{2}}{R_{1-2}}+\frac{E_{b 3}-J_{2}}{R_{2-3}}+\frac{E_{b 2}-J_{2}}{R_{2}}
$$

Here $\mathrm{J}_{1}$ in terms of $\mathrm{J}_{2}$

$$
\begin{aligned}
\mathrm{J}_{2} & =11.6 \mathrm{~kW} / \mathrm{m}^{2} \\
\text { And } \quad \mathrm{J}_{1} & =25.0 \mathrm{~kW} / \mathrm{m}^{2}
\end{aligned}
$$

The total heat loss by plate (1) is

$$
Q_{1}=\frac{E_{b 1}-J_{1}}{\frac{1-\epsilon_{1}}{\epsilon_{1} A_{1}}}=\frac{107.4-25}{4.00}=20.6 \mathrm{~kW}
$$

The total heat loss by plate (2) is

$$
Q_{1}=\frac{E_{b 2}-J_{2}}{\frac{1-\epsilon_{2}}{\epsilon_{2} A_{2}}}=\frac{11.7-11.6}{1.00}=0.1 \mathrm{~kW}
$$

The total heat received by the room is

$$
\begin{gathered}
Q_{3}=Q_{1}+Q_{2} \\
Q_{3}=20.6+0.1 \\
Q_{3}=20.7 \mathrm{~kW}
\end{gathered}
$$

Net energy lost by the plates $=$ Absorbed by the room.
6. Two large parallel planes with emissivities of 0.3 and 0.5 are maintained at temperatures of $527^{\circ} \mathrm{C}$ and $127^{\circ} \mathrm{C}$ respectively. A radiation shield having emissivities of $\mathbf{0 . 0 5}$ on both sides is placed between them. Calculate
(i) Heat transfer rate between them without shield.
(ii) Heat transfer rate between them with shield.

## Given:

$$
\begin{aligned}
& \epsilon_{1}=0.3 \\
& \epsilon_{2}=0.5 \\
& \epsilon=0.05 \\
& \mathrm{~T}_{1}=527+273=800 \mathrm{~K}
\end{aligned}
$$

$$
\mathrm{T}_{2}=127+273=400 \mathrm{~K}
$$

## Find:

$\mathrm{Q}_{\text {w/o shield }}$ and Q with shield

## Radiation Heat Exchange between Surfaces

## Solution:

$$
\begin{gathered}
\left(Q_{12}\right)_{\text {net without shield }}=\frac{\sigma\left(T_{1}^{4}-T_{2}^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{2}}-1} \\
=\frac{5.67\left(\left(\frac{800}{100}\right)^{4}-\left(\frac{400}{100}\right)^{4}\right)}{\frac{1}{0.3}+\frac{1}{0.5}-1} \\
\left(Q_{12}\right)_{\text {net without shield }}=5024.5 \mathrm{~W} / \mathrm{m}^{2} \\
\left(Q_{12}\right)_{\text {with shield }}=\frac{\sigma\left(T_{1}^{4}-T_{2}^{4}\right)}{\left(\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{3}}-1\right)+\left(\frac{1}{\epsilon_{3}}+\frac{1}{\epsilon_{2}}-1\right)} \\
=\frac{5.67\left(8^{4}-4^{4}\right)}{\left(\frac{1}{0.3}+\frac{1}{0.05}-1\right)+\left(\frac{1}{0.05}+\frac{1}{0.5}-1\right)} \\
\left(Q_{12}\right)_{\text {with shield }}=859.45 \mathrm{~W} / \mathrm{m}^{2}
\end{gathered}
$$

## November 2012

7. Emissivities of two large parallel plates maintained at $800^{\circ} \mathrm{C}$ and $300^{\circ} \mathrm{C}$ are 0.3 and 0.5 respectively. Find the net radiant heat exchange per square meter of the plates. If a polished aluminium shield $(€=0.05)$ is placed between them. Find the percentage of reduction in heat transfer.

## Given:

$$
\begin{aligned}
& \mathrm{T}_{1}=800^{\circ} \mathrm{C}+273=1073 \mathrm{~K} \\
& \mathrm{~T}_{2}=300^{\circ} \mathrm{C}+273=573 \mathrm{~K} \\
& \varepsilon_{1}=0.3 \\
& \varepsilon_{2}=0.3
\end{aligned}
$$

Radiation shield emissivity $\varepsilon_{3}=0.05$

Fig. 4.27.

## To find:

(i) Net radiant heat exchange per square meter $\left[\frac{Q_{12}}{A}\right]$
(ii) Percentage of reduction in heat transfer due to radiation shield.

## Solution:

## Case I: Heat transfer without radiation shield:

Heat exchange between two large parallel plates without radiation shield is given by

$$
Q_{12}=\vec{\varepsilon} \sigma A\left[T_{1}{ }^{4}-T_{2}{ }^{4}\right]
$$

Where

$$
\left.\begin{array}{c}
\vec{\varepsilon}=\frac{1}{\frac{1}{\varepsilon_{1}}+\frac{1}{\varepsilon_{2}}-1} \\
=\frac{1}{\frac{1}{0.3}+\frac{1}{0.5}-1} \\
\vec{\varepsilon}=0.230
\end{array} Q_{12}=0.230 \times 5.67 \times 10^{-8} \times A \times\left[(1073)^{4}-(573)^{4}\right]\right] .
$$

Heat transfer without radiation shield $\left[\frac{Q_{12}}{A}\right]=15.8 \times 10^{3} \mathrm{~W} / \mathrm{m}^{2}$
Case II: Heat transfer with radiation shield:
Heat exchange between plate I and radiation shield 3 is given by

$$
Q_{13}=\vec{\varepsilon} \sigma A\left[T_{1}{ }^{4}-T_{3}{ }^{4}\right]
$$

Where

$$
\begin{array}{r}
\vec{\varepsilon}=\frac{1}{\frac{1}{\varepsilon_{1}}+\frac{1}{\varepsilon_{3}}-1} \\
Q_{13}=\frac{\sigma A\left[T_{1}{ }^{4}-T_{3}{ }^{4}\right]}{\frac{1}{\varepsilon_{1}}+\frac{1}{\varepsilon_{3}}-1} \tag{1}
\end{array} .
$$

Heat exchange between radiation shield 3 and plate 2 is given by

$$
Q_{32}=\vec{\varepsilon} \sigma A\left[T_{3}{ }^{4}-T_{2}{ }^{4}\right]
$$

Where

$$
\begin{array}{r}
\vec{\varepsilon}=\frac{1}{\frac{1}{\varepsilon_{3}}+\frac{1}{\varepsilon_{2}}-1} \\
Q_{32}=\frac{\sigma A\left[T_{3}{ }^{4}-T_{2}{ }^{4}\right]}{\frac{1}{\varepsilon_{3}}+\frac{1}{\varepsilon_{2}}-1} \tag{2}
\end{array} .
$$

We know that,

$$
\begin{aligned}
& Q_{13}=Q_{32} \\
& \frac{\sigma A\left[T_{1}{ }^{4}-T_{3}{ }^{4}\right]}{\frac{1}{\varepsilon_{1}}+\frac{1}{\varepsilon_{3}}-1}=\frac{\sigma A\left[T_{3}{ }^{4}-T_{2}{ }^{4}\right]}{\frac{1}{\varepsilon_{3}}+\frac{1}{\varepsilon_{2}}-1} \\
& =\frac{\frac{(1073)^{4}-T_{3}{ }^{4}}{\frac{1}{0.3}+\frac{1}{0.05}-1}=\frac{T_{3}{ }^{4}-(573)^{4}}{\frac{1}{0.05}+\frac{1}{0.5}-1}}{=} \begin{array}{c}
\frac{(1073)^{4}-T_{3}{ }^{4}}{22.3}=\frac{T_{3}{ }^{4}-(573)^{4}}{21} \\
=2.78 \times 10^{13}-21 T_{3}{ }^{4}=22.3 T_{3}{ }^{4}-2.4 \times 10^{12} \\
=3.02 \times 10^{13}=43.3 T_{3}{ }^{4}
\end{array}
\end{aligned}
$$

Shield temperature $T_{3}=913.8 \mathrm{~K}$
Heat transfer with radiation shield $\mathrm{Q}_{13}=$

$$
\begin{gathered}
Q_{13}=\frac{\sigma A\left[T_{1}{ }^{4}-T_{3}{ }^{4}\right]}{\frac{1}{\varepsilon_{1}}+\frac{1}{\varepsilon_{3}}-1} \\
Q_{13}=\frac{5.67 \times 10^{-8} \times A \times\left[(1073)^{4}-(913.8)^{4}\right]}{\frac{1}{0.3}+\frac{1}{0.05}-1}
\end{gathered}
$$

$$
\begin{equation*}
\frac{Q_{13}}{A}=1594.6 \mathrm{~W} / \mathrm{m}^{2} \tag{3}
\end{equation*}
$$

$\%$ of reduction in heat transfer $=\frac{Q_{\text {without shield }}-Q \text { with shield }}{Q_{\text {without shield }}}$
due to radiation shield

$$
\begin{gathered}
=\frac{Q_{12}-Q_{13}}{Q_{12}} \\
=\frac{15.8 \times 10^{3}-1594.6}{15.8 \times 10^{3}} \\
=0.899=89.9 \%
\end{gathered}
$$

8. Two rectangular surfaces are perpendicular to each other with a common edge of 2 m . the horizontal plane is $\mathbf{2} \mathbf{~ m}$ long and vertical plane is $\mathbf{3} \mathbf{~ m}$ long. Vertical plane is at 1200 K and has an emissivity of 0.4. the horizontal plane is $18^{0} \mathrm{C}$ and has a emissivity of 0.3 . Determine the net heat exchange between the planes.

## Solution:

$$
\begin{aligned}
& \mathrm{Q}_{12}=\text { ? } \\
& \qquad Q_{12}=(F g)_{1-2} A_{1} \sigma\left(T_{1}^{4}-T_{2}^{4}\right)
\end{aligned}
$$

## Here

$$
(F g)_{1-2}=\frac{1}{\frac{1-\epsilon_{1}}{\epsilon_{1}}+\frac{1}{F_{1-2}}+\left(\frac{1-\epsilon_{2}}{\epsilon_{2}}\right) \frac{A_{1}}{A_{2}}}
$$

$\mathrm{A}_{1}=$ Area of horizontal plane $=\mathrm{XY}=2 \mathrm{x} 2=4 \mathrm{~m}^{2}$
$\mathrm{A}_{2}=$ Area of vertical plane $=\mathrm{ZX}=3 \times 2=6 \mathrm{~m}^{2}$
Both surfaces have common edge for which

$$
\frac{Z}{X}=\frac{3}{2}=1.5 \text { and } \frac{Y}{X}=\frac{2}{2}=1
$$

From HMT data book the shape factor $\mathrm{F}_{1-2}=0.22$

$$
\begin{gathered}
Q_{12}=\frac{4 \times 5.67\left(\left(\frac{1200}{100}\right)^{4}-\left(\frac{18+273}{100}\right)^{4}\right)}{\frac{1-0.4}{0.4}+\frac{1}{0.22}+\left(\frac{1-0.3}{0.3}\right) \frac{4}{6}} \\
Q_{12}=61657.7 \mathrm{~W}
\end{gathered}
$$

9. Determine the view factor $\left(F_{14}\right)$ for the figure shown below.

From Fig. We know that

$$
\begin{aligned}
& \mathrm{A}_{5}=\mathrm{A}_{1}+\mathrm{A}_{2} \\
& \mathrm{~A}_{6}=\mathrm{A}_{3}+\mathrm{A}_{4}
\end{aligned}
$$

Further,

$$
\begin{aligned}
A_{5} F_{5}= & A_{1} F_{1-6}+A_{2} F_{2-6} \\
& {\left[\because A_{5}=A_{1}+A_{2} ; F_{5-6}=F_{1-6}+F_{2-6}\right] }
\end{aligned}
$$

$$
\begin{align*}
= & \mathrm{A}_{1} \mathrm{~F}_{1-3}+\mathrm{A}_{1} \mathrm{~F}_{1-4}+\mathrm{A}_{2} \mathrm{~F}_{2-6} \\
& {\left[\because \mathrm{~A}_{5}=\mathrm{A}_{1}+\mathrm{A}_{2} ; \mathrm{F}_{5-6}=\mathrm{F}_{1-6}+\mathrm{F}_{2-6}\right] } \\
\mathrm{A}_{5} \mathrm{~F}_{5-6}= & \mathrm{A}_{5} \mathrm{~F}_{5-3}-\mathrm{A}_{2} \mathrm{~F}_{2-3}+\mathrm{A}_{1} \mathrm{~F}_{1-4}+\mathrm{A}_{2} \mathrm{~F}_{2-6} \\
& {\left[\because \mathrm{~A}_{1}=\mathrm{A}_{5}+\mathrm{A}_{2} ; \mathrm{F}_{1-3}=\mathrm{F}_{5-3}-\mathrm{F}_{2-3}\right] } \\
\Rightarrow \mathrm{A}_{1} \mathrm{~F}_{1-4}= & \mathrm{A}_{5} \mathrm{~F}_{5-6}-\mathrm{A}_{5} \mathrm{~F}_{5-3}+\mathrm{A}_{2} \mathrm{~F}_{2-3}-\mathrm{A}_{2} \mathrm{~F}_{2-6} \\
\Rightarrow \mathrm{~F}_{1-4}= & \frac{A_{5}}{A_{1}}\left[F_{5-6}-F_{5-3}\right]+\frac{A_{2}}{A_{1}}\left[F_{2-3}-F_{2-6}\right] \tag{1}
\end{align*}
$$

[Refer HMT Data book, page No. 94 (sixth Edition)

Shape factor for the area $\mathrm{A}_{5}$ and $\mathrm{A}_{6}$

Fig. 4.53.

$$
\begin{aligned}
& \mathrm{Z}=\frac{L_{2}}{B}=\frac{2}{1}=2 \\
& \mathrm{Y}=\frac{L_{1}}{B}=\frac{2}{1}=2
\end{aligned}
$$

Z value is $2, \mathrm{Y}$ value is 2 . From that, we can find corresponding shape factor value is 0.14930 .
(From tables)

$$
\mathrm{F}_{5-6}=0.14930
$$

Shape factor for the area $A_{5}$ and $A_{3}$

Fig. 4.54.

$$
\begin{array}{ll}
\mathrm{Z} & =\frac{L_{2}}{B}=\frac{1}{1}=1 \\
\mathrm{Y} & =\frac{L_{1}}{B}=\frac{2}{1}=2 \\
\mathrm{~F}_{5-3} & =0.11643
\end{array}
$$

## Shape factor for the area $A_{2}$ and $A_{3}$

Fig. 4.55.

$$
\begin{aligned}
& \mathrm{Z}=\frac{L_{2}}{B}=\frac{1}{1}=1 \\
& \mathrm{Y}=\frac{L_{1}}{B}=\frac{1}{1}=1 \\
& \mathrm{~F}_{2-3}=0.20004
\end{aligned}
$$

Shape factor for the area $\mathbf{A}_{\mathbf{2}}$ and $\mathbf{A}_{\mathbf{6}}$

Fig. 4.56.

$$
\begin{array}{ll}
\mathrm{Z} & =\frac{L_{2}}{B}=\frac{2}{1}=1 \\
\mathrm{Y} & =\frac{L_{1}}{B}=\frac{1}{1}=1
\end{array}
$$

$\mathrm{F}_{2-6}=0.23285$
Substitute $\mathrm{F}_{5-6}, \mathrm{~F}_{5-3}, \mathrm{~F}_{2-3}$, and $\mathrm{F}_{2-6}$ values in equation (1),
$\Rightarrow \mathrm{F}_{1-4} \quad=\quad \frac{A_{5}}{A_{1}}[0.14930-0.11643]+\frac{A_{2}}{A_{1}}[0.20004-0.23285]$

$$
\begin{aligned}
& =\frac{A_{5}}{A_{1}}[0.03287]-\frac{A_{2}}{A_{1}}[0.03281] \\
\mathrm{F}_{1-4} & =0.03293
\end{aligned}
$$

## Result :

View factor, $\mathrm{F}_{1-4}=0.03293$
10. Calculate the net radiant heat exchange per $\mathbf{m}^{2}$ area for two large parallel plates at temperatures of $427^{0} \mathrm{C}$ and $27^{\circ} \mathrm{C} . \boldsymbol{\epsilon}_{\text {(hot plate }}=0.9$ and $\boldsymbol{\epsilon}_{\text {(cold plate) }}=\mathbf{0 . 6}$.If a polished aluminium shield is placed between them, find the $\%$ reduction in the heat transfer $\epsilon_{\text {(shield) }}=0.4$

Net radiation heat transfer $\left(\mathrm{Q}_{12}\right)_{\text {net }}=$ ?
Given:

$$
\begin{aligned}
& \mathrm{T}_{1}=427+273=700 \mathrm{~K} \\
& \mathrm{~T}_{2}=27+273=300 \mathrm{~K} \\
& \epsilon_{1}=0.9 \\
& \epsilon_{2}=0.6 \\
& \epsilon=0.4
\end{aligned}
$$

## Solution:

$$
\begin{gathered}
\left(Q_{12}\right)_{\text {net without shield }}=\frac{\sigma\left(T_{1}{ }^{4}-T_{2}{ }^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{2}}-1} \\
=\frac{5.67\left(\left(\frac{700}{100}\right)^{4}-\left(\frac{300}{100}\right)^{4}\right)}{\frac{1}{0.9}+\frac{1}{0.6}-1} \\
\left(Q_{12}\right)_{n e t}=7399.35 \mathrm{~W} / \mathrm{m}^{2}
\end{gathered}
$$

Percentage reduction in the heat transfer flow

$$
=\frac{\text { Reduction in heat flow due to shield }}{\text { Net heat flow }} \times 100
$$

Reduction in heat flow due to shield $=\left(Q_{12}\right)_{n e t}-\left(Q_{13}\right)_{n e t}$

$$
\left(Q_{13}\right)_{n e t ~ w i t h ~ s h i e l d ~}=\frac{A \sigma\left(T_{1}{ }^{4}-T_{3}{ }^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{3}}-1}
$$

To find $\mathrm{T}_{3}$ shield temperature $\left(Q_{13}\right)_{\text {net }}=\left(Q_{32}\right)_{\text {net }}$

$$
\frac{A \sigma\left(T_{1}^{4}-T_{3}^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{3}}-1}=\frac{A \sigma\left(T_{3}^{4}-T_{2}^{4}\right)}{\frac{1}{\epsilon_{3}}+\frac{1}{\epsilon_{2}}-1}
$$

Let $\frac{T_{3}}{100}=x$

$$
\begin{gathered}
\frac{\left(\left(\frac{700}{100}\right)^{4}-\left(\frac{T_{3}}{100}\right)^{4}\right)}{\frac{1}{0.9}+\frac{1}{0.4}-1}=\frac{\left(\left(\frac{T_{3}}{100}\right)^{4}-\left(\frac{300}{100}\right)^{4}\right)}{\frac{1}{0.4}+\frac{1}{0.6}-1} \\
\frac{2401-x^{4}}{1.11+25-1}=\frac{x^{4}-81}{25+1.67-1} \\
x^{4}=1253.8 \\
\frac{T_{3}}{100}=(1253.8)^{1 / 4}=5.95 \\
T_{3}=595 \mathrm{~K} \\
\left(Q_{13}\right)_{n e t}=\frac{\sigma\left(T_{1}{ }^{4}-T_{3}^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{3}}-1} \\
=\frac{5.67\left(\left(\frac{700}{100}\right)^{4}-\left(\frac{595}{100}\right)^{4}\right)}{\frac{1}{0.9}+\frac{1}{0.4}-1} \\
\left(Q_{13}\right)_{n e t}=2492.14 \mathrm{~W} / \mathrm{m}^{2}
\end{gathered}
$$

Reduction in heat flow due to shield $=\left(Q_{12}\right)_{n e t}-\left(Q_{13}\right)_{n e t}$

$$
\begin{aligned}
& =7399.35-2492.14 \\
& =4907.21 \mathrm{~W} / \mathrm{m}^{2}
\end{aligned}
$$

Percentage reduction $=\frac{4907.21}{7399.35} \times 100=66.32 \%$
11. There are two large parallel plane with emissivities 0.3 and 0.8 exchange heat. Find the percentage reduction when an aluminium shield of emissivity 0.04 is $p$ [laced between them. Use the method of electrical analogy.

## Solution:

Given:

$$
\begin{aligned}
& \epsilon_{1}=0.3 \\
& \epsilon_{2}=0.8 \\
& \epsilon=0.04
\end{aligned}
$$

Percentage reduction in heat transfer

$$
\begin{gathered}
=\frac{\text { Reduction in heat transfer due to shield }}{\text { Net heat transfer rate }} \times 100 \\
\text { Reduction in heat flow due to shield }=\frac{\left(Q_{12}\right)_{n e t}-\left(Q_{13}\right)_{n e t}}{\left(Q_{12}\right)_{n e t}} \\
\left(Q_{12}\right)_{\text {net } w / o \text { shield }}=\frac{\sigma\left(T_{1}{ }^{4}-T_{2}^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{2}}-1}=\frac{\sigma\left(T_{1}{ }^{4}-T_{2}{ }^{4}\right)}{\frac{1}{0.3}+\frac{1}{0.8}-1}=\frac{\sigma\left(T_{1}{ }^{4}-T_{2}{ }^{4}\right)}{3.58} \\
\left(Q_{13}\right)_{\text {net with shield }}=\frac{\sigma\left(T_{1}{ }^{4}-T_{3}{ }^{4}\right)}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{3}}-1}=\frac{\sigma\left(T_{1}^{4}-T_{3}{ }^{4}\right)}{\frac{1}{0.3}+\frac{1}{0.04}-1}=\frac{\sigma\left(T_{1}{ }^{4}-T_{3}{ }^{4}\right)}{27.33}
\end{gathered}
$$

Percentage reduction in heat transfer

$$
=1-\frac{\left(Q_{13}\right)}{\left(Q_{12}\right)}
$$

Here $\mathrm{T}_{3}=\mathrm{in}$ terms of $\mathrm{T}_{1}$ and $\mathrm{T}_{2}$
To find the values of $\mathrm{T}_{3}$

$$
\begin{gathered}
\left(Q_{13}\right)_{n e t}=\left(Q_{32}\right)_{\text {net }} \\
\frac{T_{1}{ }^{4}-T_{3}{ }^{4}}{\frac{1}{\epsilon_{1}}+\frac{1}{\epsilon_{3}}-1}=\frac{T_{3}{ }^{4}-T_{2}{ }^{4}}{\frac{1}{\epsilon_{3}}+\frac{1}{\epsilon_{2}}-1} \\
\frac{T_{1}{ }^{4}-T_{3}{ }^{4}}{27.33}=\frac{T_{3}{ }^{4}-T_{2}{ }^{4}}{25.25} \\
T_{1}{ }^{4}-T_{3}{ }^{4}=\frac{27.33}{25.25}\left(T_{3}{ }^{4}-T_{2}{ }^{4}\right) \\
T_{3}{ }^{4}=0.48\left(T_{1}{ }^{4}+1.08 T_{2}{ }^{4}\right)
\end{gathered}
$$

Percentage reduction in heat transfer

$$
\begin{gathered}
=1-\frac{\left(Q_{13}\right)}{\left(Q_{12}\right)} \\
=1-\frac{\sigma\left(T_{1}{ }^{4}-T_{3}{ }^{4}\right) / 27.33}{\sigma\left(T_{1}{ }^{4}-T_{2}{ }^{4}\right) / 27.33}
\end{gathered}
$$

$$
\begin{gathered}
=1-\frac{3.58}{27.33}\left[\frac{\left(T_{1}^{4}-T_{3}^{4}\right)}{\left(T_{1}^{4}-T_{2}^{4}\right)}\right] \\

=0.932 \\
=93.2 \%
\end{gathered}
$$

## V: MASS TRANSFER

Mass transfer is different from the flow of fluid which was discussed in previous chapters. Mass transfer is the flow of molecules from one body to another when these bodies are in contact or within a system consisting of two components when the distribution of materials is not uniform. When a copper plate is placed on a steel plate, some molecules from either side will diffuse into the other side Usually mass transfer takes place from a location where the particular component is proportionately high to a location where the component is proportionately low. Mass transfer may also take place due to potentials other than concentration difference. But in this chapter only transfer due to concentration gradient is discussed

## PROPERTIES OF MIXTURE

In a mixture consisting of two or more materials the mass per unit volume of any component is called mass concentration of that component. If there are two components $A$ and $B$, then the mass concentration of $A$ is
$M a=\frac{\text { mass of in the mixture }}{\text { volume of the mixture }}$
and concentration of $B$,

$$
m b \quad=\quad \frac{\text { mass of in the mixture }}{\text { volume of the mixture }}
$$

The total mass concentration is $m_{a}+m b$, which is also the density of the mixture.
Mass concentration can also be expressed in terms of individual and total densities of the mixture i.e.,

where $\rho_{a}$ is the density of $A$ in the mixture and $\rangle$ is the density of the mixture.
It is more convenient to express the concentration in terms of the molecular weight of the component.
Mole fraction $N a$ can be expressed as

where R is universal gas constant.
At the temperature $T$ of the mixture then

$$
N_{i} \propto P_{i}
$$

where

$$
C_{a}=\frac{N_{a}}{N t}=\frac{P_{a}}{P_{T}}
$$

where $P_{a}$ is the partial pressure of $A$ in the mixture and $P_{T}$ is the total pressure of the mixture. $C_{a}$ is the mole concentration of $A$ in the mixture.
Also $C a+C b=1$ for a two component mixture.

## DIFFUSION MASS TRANSFER

Consider a chamber in which two different gases at the same pressure and temperature are kept separated by a thin barrier. When the barrier is removed, the gases will begin to diffuse into each other's, volume. After some time, a steady condition of uniform mixture would be reached. This type of diffusion can occur in solids also. The rate in solids will be extremely slow. Diffusion in these situations occurs at the molecular level and the governing equations are similar to those in heat conduction where energy transfer occurs at the molecular level

## FICK'S LAW OF DIFFUSION

The Fick's law can be stated as

$$
N_{a}=-D_{a b} \frac{d C_{a}}{d x}
$$

Where $\quad \mathrm{N}_{\mathrm{a}} —>$ number of moles of ' a ' diffusing perpendicular to area $\mathrm{A}, \mathrm{moles} / \mathrm{m}^{2}$ sec
Dab—> Diffusion coefficient or mass diffusivity, $\mathrm{m}^{2} / \mathrm{s}$, a into b
$C a \longrightarrow>$ mole concentration of ' $a$ ' moles $/ \mathrm{m}^{3}$
$x —>$ diffusion direction
The diffusion coefficient is similar to thermal diffusivity, 〈and momentum diffusivity $v$. Number of moles multiplied by the molecular mass (or more popularly known as molecular weight) will provide the value of mass transfer in $\mathrm{kg} / \mathrm{s}$.

Equation above can also be written as

$$
\frac{m_{a}}{A}=-D_{a b} \cdot \frac{d \rho_{a}}{d x}
$$

The value of $D_{a b}$ for certain combinations of components are available in literature. It can be proved that $D a b=D b a$. When one molecule of ' $A$ ' moves in the $x$ direction, one molecule of ' $B$ ' has to move in the opposite direction. Otherwise a macroscopic density gradient will develop, which is not sustainable

$$
\begin{aligned}
& \frac{N_{a}}{A}=-D_{a b} \frac{d C_{a}}{d x} \\
& \frac{N_{b}}{A}=-D_{b a} \frac{d C_{b}}{d x}=-D_{b a} \frac{d\left(1-C_{a}\right)}{d x}=D_{b a} \frac{d C_{a}}{d x} \\
& \frac{N_{a}}{A}=-\frac{N_{b}}{A} \text { and so } D_{a b}=D_{b a}
\end{aligned}
$$

## EQUIMOLAL COUNTER DIFFUSION

The total pressure is constant all through the mixture. Hence the difference in partial pressures will be equal. The Fick's equation when integrated for a larger plane volume of thickness $L$ will give

$$
\begin{aligned}
& \frac{N_{a}}{A}=D_{a b} \frac{\left(C_{a 1}-C_{a 2}\right)}{L} \\
& \frac{N_{b}}{A}=D_{b a} \frac{\left(C_{b 2}-C_{b 1}\right)}{L} \\
& \frac{N_{b}}{A}=-\frac{N_{a}}{A}, \text { and }\left(C_{a 1}-C_{a 2}\right)=\left(C_{b 2}-C_{b 1}\right),
\end{aligned}
$$

$D_{a b}$ equals $D b a$ Where $C_{a 1}$ and $C b 1$ are the mole concentrations at face 1 and $C_{a 2}$ and $C b 2$ are mole concentrations at face 2 which is at a distance $L$ from the first face. When applied to gases,

$$
\frac{N_{a}}{A}=\frac{D}{\Re T} \cdot \frac{P_{a 1}-P_{a 2}}{\left(x_{2}-x_{1}\right)}
$$

Where $P_{a 1}$ and $P_{a 2}$ are partial pressures of component ' $A$ ' at $x_{1}$ and $x_{2}$ and R is the universal gas constant in $\mathrm{J} / \mathrm{kg}$ mol K. $T$ is the temperature in absolute units. The distance should be expressed in metre.

The partial pressure variation and diffusion directions are shown in Fig

## DIFFUSION OF ONE COMPONENT INTO A STATIONARYCOMPONENT OR UNIDIRECTIONAL DIFFUSION

In this case one of the components diffuses while the other is stationary. For steady conditions the mass diffused should be absorbed continuously at the boundary. In certain cases this is not possible. The popular example is water evaporating into air. In this case, as mentioned earlier, a bulk motion replaces the air tending to accumulate at the interface without being absorbed, causing an increase in the diffusion rate. The diffusion equation for gases can be derived as (with ' $a$ ' as the diffusing medium and $\mathrm{P}=$ total pressure)

$$
\frac{N_{a}}{A}=\frac{P}{\Re T} \cdot \frac{D}{\left(x_{2}-x_{1}\right)} \cdot \ln \left(\frac{P-P_{a 2}}{P-P_{a 1}}\right)
$$

## CONVECTIVE MASS TRANSFER

When a medium deficient in a component flows over a medium having an abundance of the component, then the component will diffuse into the flowing medium. Diffusion in the opposite direction will occur if the mass concentration levels of the component are interchanged. In this case a boundary layer develops and at the interface mass transfer occurs by molecular diffusion (In heat flow at the interface, heat transfer is by conduction).

Velocity boundary layer is used to determine wall friction. Thermal boundary layer is used to determine convective heat transfer. Similarly concentration boundary layer is used to determine convective mass transfer. The Fig. shows the flow of a mixture of components $A$ and $B$ with a specified constant concentration over a surface rich in component $A$. A concentration boundary layer develops. The concentration gradient varies from the surface to the free stream. At the surface the mass transfer is by diffusion. Convective mass transfer coefficient $h_{m}$ is defined by the equation, where $h_{m}$ has a unit of $\mathrm{m} / \mathrm{s}$.

By similarity the solutions for boundary layer thickness for connective mass transfer can be obtained. This is similar to the heat transfer by analogy. In this case, in the place of Prandtl number Schmidt number defined by

$$
\mathrm{Sc}=v / D_{a b} \ldots
$$

Nondimensionalising the equation leads to the condition as below:

$$
\begin{aligned}
& \delta_{m}=f(\mathrm{Re}, \mathrm{Sc}) \\
& \mathrm{Sh}=f(\mathrm{Re}, \mathrm{Sc})
\end{aligned}
$$

where Sherwood number Sh is defined as

$$
\mathrm{Sh}=h_{m} x / D_{a b}
$$

In the laminar region flow over plate :

$$
\begin{aligned}
& \delta_{m x}=\frac{5 \mathrm{x}}{\operatorname{Re}^{1 / 2}} \quad \mathrm{Sc}^{-1 / 3} \\
& \mathrm{Sh}_{x}=\frac{\mathrm{h}_{\mathrm{m}} \mathrm{X}}{\mathrm{D}_{\mathrm{ab}}}=0 . .332 \mathrm{Re}^{1 / 2} \mathrm{Sc}^{1 / 3}
\end{aligned}
$$

In turbulent region $\operatorname{Re}>5 \times 10^{5}$

$$
\begin{gathered}
\delta_{\mathrm{m}}=\delta_{\mathrm{v}} \\
\mathrm{Sh}_{\mathrm{x}}=0.0296 \mathrm{Rex}^{0.8} \mathrm{Sc}^{1 / 3} \\
\overline{\operatorname{ShL}}=0.037 \mathrm{Re}_{\mathrm{L}}^{0.8} \mathrm{Sc}^{1 / 3}
\end{gathered}
$$

## SIMILARITY BETWEEN HEAT AND MASS TRANSFER

It is possible from similarity between the heat convection equation and mass convection equation to obtain value of $h_{m}$. (i.e., called as Lewis number)

$$
\frac{h}{h_{m}}=\rho C_{p} / L e^{2 / 3}
$$

Where

$$
L e=\frac{\alpha}{D}
$$

Many of the correlation in heat transfer can be applied to mass transfer under similar condition, by replacing Nusselt number by Sherwood number and Prandtl number by Schmidt number

## UNIT-V

1. Water flows at the rate of $65 \mathrm{~kg} / \mathrm{min}$ through a double pipe counter flow heat exchanger. Water is heated from $50^{\circ} \mathrm{C}$ to $75^{\circ} \mathrm{C}$ by an oil flowing through the tube. The specific heat of the oil is $1.780 \mathrm{kj} / \mathrm{kg}$.K. The oil enters at $115^{\circ} \mathrm{C}$ and leaves at $70^{\circ}$ C.the overall heat transfer co-efficient is $340 \mathrm{~W} / \mathrm{m} 2 \mathrm{~K}$.calcualte the following
2. Heat exchanger area
3. Rate of heat transfer

## Given:

Hot fluid - oil,
( $\mathrm{T}_{1}, \mathrm{~T}_{2}$ )

Cold fluid - water

$$
\left(\mathrm{t}_{1}, \mathrm{t}_{2}\right)
$$

Mass flow rate of water (cold fluid), $\mathrm{m}_{\mathrm{c}}=65 \mathrm{~kg} / \mathrm{min}$

$$
\begin{aligned}
= & 65 / 60 \mathrm{~kg} / \mathrm{s} \\
\mathbf{m}_{\mathbf{c}} & =\mathbf{1 . 0 8} \mathbf{~ k g} / \mathbf{s}
\end{aligned}
$$

Entry temperature of water, $\mathrm{t}_{1}=50^{\circ} \mathrm{C}$
Exit temperature of water, $\mathrm{t}_{2}=75^{\circ} \mathrm{C}$
Specific heat of oil (Hot fluid), $\mathrm{C}_{\mathrm{ph}}=1.780 \mathrm{KJ} / \mathrm{kg} \mathrm{K}$

$$
=1.780 \times 10^{3} \mathrm{~J} / \mathrm{kg} \mathrm{~K}
$$

Entry temperature of oil, $\mathrm{T}_{1}=115^{\circ} \mathrm{C}$
Exit temperature of water, $\mathrm{T}_{2}=70^{\circ} \mathrm{C}$
Overall heat transfer co-efficient, $\mathrm{U}=340 \mathrm{w} / \mathrm{m}^{2} \mathrm{~K}$

## To find:

1. Heat exchanger area, (A)
2. Rate of heat transfer, (Q)

## Solution:

We know that,
Heat transfer, $\mathrm{Q}=\mathrm{m}_{\mathrm{c}} \mathrm{c}_{\mathrm{pc}}\left(\mathrm{t}_{2}-\mathrm{t}_{1}\right)$ (or) $\mathrm{m}_{\mathrm{h}} \mathrm{c}_{\mathrm{ph}}\left(\mathrm{T}_{1}-\mathrm{T}_{2}\right)$

$$
\begin{aligned}
& \mathrm{Q}=\mathrm{m}_{\mathrm{c}} \mathrm{C}_{\mathrm{pc}}\left(\mathrm{t}_{2}-\mathrm{t}_{1}\right) \\
& \mathrm{Q}=1.08 \times 4186 \times(75-50)
\end{aligned}
$$

[Specific heat of water, $\mathrm{c}_{\mathrm{pc}}=4186 \mathrm{~J} / \mathrm{kg} \mathrm{K}$ ]

$$
Q=113 \times 10^{3} \mathrm{~W}
$$

We know that,
Heat transfer, $\mathrm{Q}=\mathrm{U} \times \mathrm{A}(\Delta \mathrm{T})_{\mathrm{m}}$
[From HMT data book page no:152(sixth edition)]

Where
$\Delta \mathrm{T}_{\mathrm{m}}$ - Logarithmic Mean Temperature Difference. (LMTD)
For counter flow,

$$
\begin{gathered}
\Delta \mathrm{T}_{\mathrm{lm}}=\frac{\left[\left(T_{1}-t_{2}\right)-\left(T_{2}-t_{1}\right)\right.}{\ln \left[\frac{T_{1}-t_{2}}{T_{2}-t_{1}}\right]} \\
\Delta \mathrm{T}_{\mathrm{lm}}=\mathbf{2 8 . 8 ^ { \mathbf { o } } \mathbf { C }}
\end{gathered}
$$

Substitute $(\Delta T)_{\mathrm{lm}}, \mathrm{Q}$ and U values in Equn (1)

$$
\begin{align*}
& \mathrm{Q}=\mathrm{UA}(\Delta \mathrm{~T})_{\mathrm{lm}}  \tag{1}\\
& 113 \times 10^{3}=340 \times \mathrm{A} \times 28.8 \\
& \mathbf{A}=\mathbf{1 1 . 5 4} \mathbf{~ m}^{\mathbf{2}}
\end{align*}
$$

2. A parallel flow heat exchanger is used to cool $4.2 \mathrm{~kg} / \mathrm{min}$ of hot liquid of specific heat $3.5 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ at $13 \mathbf{0}^{\boldsymbol{}} \mathrm{C}$. A cooling water of specific heat $4.18 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ is used for cooling purpose of a temperature of $15^{\circ} \mathrm{C}$. The mass flow rate of cooling water is $17 \mathrm{~kg} / \mathrm{min}$. calculate the following.
3. Outlet temperature of liquid
4. Outlet temperature of water
5. Effectiveness of heat exchanger

## Take

Overall heat transfer co-efficient is $1100 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$.
Heat exchanger area is $0.30 \mathrm{~m}^{2}$

## Given:

Mass flow rate of hot liquid, $\mathrm{m}_{\mathrm{h}}=4.2 \mathrm{~kg} / \mathrm{min}$

$$
m_{h}=0.07 \mathrm{~kg} / \mathrm{s}
$$

Specific heat of hot liquid, $\mathrm{c}_{\mathrm{ph}}=3.5 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$

$$
\mathrm{c}_{\mathrm{ph}}=3.5 \times 10^{3} \mathrm{~J} / \mathrm{kg} \mathrm{~K}
$$

Inlet temperature of hot liquid, $\mathrm{T}_{1}=130^{\circ} \mathrm{C}$

Specific heat of hot water, $\quad \mathrm{C}_{\mathrm{pc}}=4.18 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$

$$
\mathrm{C}_{\mathrm{pc}}=4.18 \times 10^{3} \mathrm{~J} / \mathrm{kg} \mathrm{~K}
$$

Inlet temperature of hot water, $\mathbf{t}_{1}=15^{\circ} \mathrm{C}$

Mass flow rate of cooling water, $\mathrm{m}_{\mathrm{c}}=17 \mathrm{~kg} / \mathrm{min}$

$$
\mathrm{m}_{\mathrm{c}}=0.28 \mathrm{~kg} / \mathrm{s}
$$

Overall heat transfer co - efficient, $\mathrm{U}=1100 \mathrm{w} / \mathrm{m}^{2} \mathrm{~K}$
Area, $\mathrm{A}=0.03 \mathrm{~m}^{2}$

## To find :

1. Outlet temperature of liquid, $\left(\mathrm{T}_{2}\right)$
2. Outlet temperature of water, $\left(\mathrm{t}_{2}\right)$
3. Effectiveness of heat exchanger, ( $\varepsilon$ )

## Solution :

Capacity rate of hot liquid, $\quad \mathrm{C}_{\mathrm{h}}=\mathrm{m}_{\mathrm{h}} \times \mathrm{C}_{\mathrm{ph}}$

$$
\begin{align*}
&=0.07 \times 3.5 \times 10^{3} \\
& \mathbf{C}_{\mathbf{h}}=\mathbf{2 4 5} \mathbf{W} / \mathbf{K} . \tag{1}
\end{align*}
$$

Capacity rate of water,

$$
\begin{align*}
& \mathrm{C}_{\mathrm{c}}=\mathrm{m}_{\mathrm{c}} \times \mathrm{C}_{\mathrm{pc}} \\
& =0.28 \times 4.18 \times 10^{3} \\
& \mathbf{C}_{\mathbf{c}}=\mathbf{1 1 7 0 . 4} \mathbf{W} / \mathrm{K} \ldots \tag{2}
\end{align*}
$$

From (1) and (2),

$$
\begin{align*}
& \mathrm{C}_{\min }=245 \mathrm{~W} / \mathrm{K} \\
& \mathrm{C}_{\max }=1170.4 \mathrm{~W} / \mathrm{K} \\
& =>\quad \frac{\mathrm{C}_{\min }}{\mathrm{C}_{\max }}=\frac{245}{1170.4}=0.209 \\
& \frac{\mathrm{C}_{\min }}{\mathrm{C}_{\max }}=\mathbf{0 . 2 0 9 \ldots \ldots \ldots . .} \tag{3}
\end{align*}
$$

Number of transfer units, $\mathrm{NTU}=\frac{\mathrm{UA}}{\mathrm{C}_{\text {min }}}$
[From HMT data book page no. 152]

$$
\begin{align*}
\Rightarrow> & \text { NTU }=\frac{1100 \times 0.30}{245} \\
& \text { NTU }=1.34 \ldots . . \tag{4}
\end{align*}
$$

To find effectiveness $\varepsilon$, refer HMT data book page no 163
(Parallel flow heat exchanger)
From graph,

$$
\begin{aligned}
& \mathrm{X}_{\mathrm{axis}} \rightarrow \mathrm{NTU}=1.34 \\
& \text { Curve } \rightarrow \frac{\mathrm{C}_{\min }}{\mathrm{C}_{\text {max }}}=0.209
\end{aligned}
$$

Corresponding $\mathrm{Y}_{\mathrm{axis}}$ value is $64 \%$

$$
\text { i.e., } \varepsilon=0.64
$$

from HMT data Book

$$
\begin{aligned}
& \in=\frac{m_{h} c p_{h}\left(T_{1}-T_{2}\right)}{C_{\min }\left(T_{1}-t_{1}\right)} \\
& 0.64=\frac{130-T_{2}}{130-15}
\end{aligned}
$$

$$
\mathrm{T}_{2}=56.4^{\circ} \mathrm{C}
$$

To find $t_{2}$

$$
\begin{aligned}
& \mathrm{m}_{\mathrm{h}} \mathrm{c} p_{\mathrm{h}}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)=\mathrm{m}_{\mathrm{c}} \mathrm{C} p_{\mathrm{c}}\left(\mathrm{t}_{2}-\mathrm{t}_{1}\right) \\
& 0.07 \times 3.5 \times 10^{3}(130-56.4)=0.28 \times 4186\left(\mathrm{t}_{2}-15\right) \\
& \quad \mathrm{t}_{2}=30.4^{\mathrm{o}} \mathrm{C}
\end{aligned}
$$

Maximum possible heat transfer

$$
\begin{aligned}
\mathrm{Q}_{\max } & =\mathrm{C}_{\min }\left(\mathrm{T}_{1}-\mathrm{t}_{1}\right) \\
& =245(130-15) \\
\mathbf{Q}_{\max }= & \mathbf{2 8 . 1 7 5} \mathbf{W}
\end{aligned}
$$

Actual heat transfer rate

$$
\begin{aligned}
& \mathrm{Q}=\varepsilon \times \mathrm{Q}_{\max } \\
& =0.64 \times 28.175 \\
& \mathbf{Q}=\mathbf{1 8 . 0 3 2} \mathbf{~ W}
\end{aligned}
$$

We know that,
Heat transfer, $\mathrm{Q}=\mathrm{m}_{\mathrm{c}} \mathrm{Cpc}_{\mathrm{pc}}\left(\mathrm{t}_{2}-\mathrm{t}_{1}\right)$

$$
\begin{array}{lrl} 
& \Rightarrow & 18.032=0.28 \times 4.18 \times 10^{3}\left(\mathrm{t}_{2}-15\right) \\
& > & 18.032=1170.4 \mathrm{t}_{2}-17556 \\
& > & \mathrm{t}_{2}=30.40^{\circ} \mathrm{C}
\end{array}
$$

## Outlet temperature of cold water, $\mathbf{t}_{\mathbf{2}}=\mathbf{3 0 . 4 0}{ }^{\mathbf{}} \mathbf{C}$

We know that,
Heat transfer, $\mathrm{Q}=\mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{ph}}\left(\mathrm{T}_{1}-\mathrm{T}_{2}\right)$

$$
\begin{array}{lc}
=> & 18.032=0.07 \times 3.5 \times 10^{3}\left(130-\mathrm{T}_{2}\right) \\
=> & 18.032=31850-245 \mathrm{~T}_{2} \\
=> & \mathrm{T}_{2}=56.4^{\circ} \mathrm{C}
\end{array}
$$

Outlet temperature of hot liguid, $\mathrm{T}_{\mathbf{2}}=\mathbf{5 6 . 4}{ }^{\mathbf{}} \mathrm{C}$
3.Hot chemical products $\left(\mathrm{C}_{\mathrm{ph}}=2.5 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}\right)$ at $600^{\circ} \mathrm{C}$ and at a flow rate of $30 \mathrm{~kg} / \mathrm{s}$ are used to heat cold chemical products $\left(C_{p}=4.2 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}\right)$ at $200^{\circ} \mathrm{C}$ and at a flow rate 20 $\mathbf{k g} / \mathrm{s}$ in a parallel flow heat exchanger. The total heat transfer is $\mathbf{5 0} \mathbf{m}^{\mathbf{2}}$ and the overall heat transfer coefficient may be taken as $1500 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$. calculate the outlet temperatures of the hot and cold chemical products.

## Given: Parallel flow heat exchanger

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{h} 1}=600^{\circ} \mathrm{C} ; \mathrm{m}_{\mathrm{h}}=30 \mathrm{~kg} / \mathrm{s} \\
& \mathrm{C}_{\mathrm{ph}}=2.5 \mathrm{~kJ} / \mathrm{kg} \mathrm{~K} \\
& \mathrm{~T}_{\mathrm{cl} 1}=100^{\circ} \mathrm{C} ; \mathrm{m}_{\mathrm{c}} 28 \mathrm{~kg} / \mathrm{s} \\
& \mathrm{C}_{\mathrm{pc}}=4.2 \mathrm{~kJ} / \mathrm{kg} \mathrm{~K} \\
& \mathrm{~A}=50 \mathrm{~m}^{2} \\
& \mathrm{U}=1500 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
\end{aligned}
$$

Find:
(i) $\mathrm{T}_{\mathrm{h} 2}$
(ii) $\mathrm{T}_{\mathrm{c} 2}$ ?

## Solution

The heat capacities of the two fluids

$$
\begin{aligned}
& \mathrm{C}_{\mathrm{h}}=\mathrm{m}_{\mathrm{h}} \mathrm{c}_{\mathrm{ph}}=30 \times 2.5=75 \mathrm{~kW} / \mathrm{K} \\
& \mathrm{C}_{\mathrm{c}}=\mathrm{m}_{\mathrm{c}} \mathrm{c}_{\mathrm{pc}}=28 \times 4.2=117.6 \mathrm{~kW} / \mathrm{K}
\end{aligned}
$$

$$
\text { The ratio } \frac{C_{\min }}{C_{\max }}=\frac{75}{117.6}=0.64
$$

$$
\mathrm{NTU}=\frac{U A}{C \min }=\frac{1500 \times 50}{75 \times 10^{3}}=1.0
$$

For a parallel flow heat exchanger, the effectiveness from Fig. 13.15 corresponding to $\frac{c_{\min }}{c_{\max }}$ and NTU

$$
\epsilon=\mathbf{0 . 4 8}
$$

We know that

$$
\begin{aligned}
\epsilon & =\frac{\text { Actual heat transfer }}{\text { Max.possible heat transfer }} \\
& =\frac{m_{h} C_{p h\left(T_{h 1}-T_{h 2}\right)}}{C_{\min \left(T_{h 1}-T_{c 1}\right)}} \\
\epsilon & =\frac{\left(T_{h 1}-T_{h 2}\right)}{\left(T_{h 1}-T_{c 1}\right)} \\
0.48 & =\frac{600-T_{h 2}}{600-100}
\end{aligned}
$$

$$
\mathrm{T}_{\mathrm{h} 2}=360^{\circ} \mathrm{C}
$$

We know that
Heat lost by the hot product $=$ Heat gained by the cold product

$$
\begin{gathered}
\mathrm{m}_{\mathrm{h}} \mathrm{c}_{\mathrm{ph}}\left(T_{h 1}-T_{h 2}\right)=\mathrm{m}_{\mathrm{c}} \mathrm{c}_{\mathrm{ph}}\left(T_{c 2}-T_{c 1}\right) \\
75(600-360)=117.6\left(T_{c 2}-100\right) \\
\boldsymbol{T}_{\boldsymbol{c} 2}=\mathbf{2 5 3 . 0 6}^{\boldsymbol{o}} \boldsymbol{C}
\end{gathered}
$$

4. Estimate the diffusion rate of water from the bottom of a tube of 10 mm diameter and 15 cm long into dry air $25^{\circ} \mathrm{C}$. Take the diffusion coefficient of water through air as $\mathbf{0 . 2 3 5}$ $\times 10^{-4} \mathrm{~m}^{2} / \mathrm{s}$

## Given:

$$
\mathrm{D}=0.255 \times 10^{-4} \mathrm{~m}^{2} / \mathrm{s}
$$

Area $(\mathrm{A})=\frac{\pi}{4} d^{2}=\frac{\pi}{4}(0.01)^{2}=7.85 \times 10^{-5} \mathrm{~m}^{2}$

$$
\mathrm{R}_{\mathrm{o}}=8314 \mathrm{~J} / \mathrm{kg}-\text { mole } \mathrm{K}
$$

$$
\mathrm{T}=25+273=298 \mathrm{~K}
$$

$$
\mathrm{M}_{\mathrm{w}}=\text { molecular weight of water }=18
$$

$$
\mathrm{P}=\text { Total pressure }=1.01325 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}
$$

$\mathrm{X}_{2}-\mathrm{X}_{1}=0.15 \mathrm{~m}$
$\mathrm{P}_{\mathrm{w} 1}=$ partial pressure at $25^{\circ} \mathrm{C}=0.03166 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$
$\mathrm{P}_{\mathrm{w} 2}=0$
Find:
Diffusion rate of water (or) Mass transfer rate of water.

## Solution

We know that

$$
\text { Molar rate of water }\left(\mathrm{M}_{\mathrm{a}}\right)
$$

$$
\begin{aligned}
\mathrm{M}_{\mathrm{a}} & =\frac{\mathrm{DA}}{\mathrm{R}_{\mathrm{o}} \mathrm{~T}} \cdot \frac{\mathrm{P}}{\mathrm{x}_{2}-\mathrm{x}_{1}} \operatorname{In}\left(\frac{\mathrm{P}_{\mathrm{a}}}{\mathrm{P}_{\mathrm{a} 1}}\right) \\
& =\frac{0.255 \times 10-4 \times 7.85 \times 10-5 \times 1.01325 \times 105}{8314 \times 298 \times 0.15} \times\left(\frac{1.01325-0}{1.01325-0.03166}\right)
\end{aligned}
$$

Here

$$
\mathrm{P}_{\mathrm{a} 2}=\mathrm{P}-\mathrm{P}_{\mathrm{w} 2}, \mathrm{P}_{\mathrm{a} 1}=\mathrm{P}-\mathrm{P}_{\mathrm{w} 1}
$$

$$
M_{a}=1.72 \times 10^{-11} \mathrm{~kg}-\mathrm{mole} / \mathrm{s}
$$

Mass transfer rate of water
(or)

$$
=\text { Molar rate of water } \mathrm{X} \text { molecular weight of steam }
$$

Diffusion rate of water

$$
\mathrm{M}_{\mathrm{w}}=1.72 \times 10^{-11} \times 18
$$

Diffusion rate of water $\left(\mathrm{M}_{\mathrm{w}}\right)=3.1 \times 10^{-10} \mathbf{~ k g} / \mathrm{s}$
5. A vessel contains a binary mixture of $\mathrm{O}_{\mathbf{2}}$ and $\mathrm{N}_{\mathbf{2}}$ with partial pressure in the ratio of 0.21 and 0.79 at $15^{\circ} \mathrm{C}$. The total pressure of the mixture is $\mathbf{1 . 1}$ bar. Calculate the following

1. Molar concentration
2. Mass densities
3. Mass fractions
4. Molar fractions.

## Given:

$$
\begin{aligned}
& \mathrm{T}=15+273=288 \mathrm{~K} \\
& \mathrm{P}=1.1 \mathrm{bar}=1.1 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2} \\
& \mathrm{P}_{\mathrm{o}_{2}}=0.21 \mathrm{bar} \\
& \mathrm{P}_{\mathrm{N}_{2}}=0.21 \mathrm{bar}
\end{aligned}
$$

## Solution

1. To find Molar concentration $\left(\mathrm{C}_{\mathrm{o}_{2}}\right.$ and $\left.\mathrm{C}_{\mathrm{o}_{2}}\right)$

$$
\begin{aligned}
& \mathrm{C}_{\mathrm{O}_{2}}=\frac{\mathrm{P}_{\mathrm{O}_{2}}}{\mathrm{R}_{\mathrm{o}} \mathrm{~T}}=\frac{0.21 \times 1.1 \times 10^{5}}{8314 \times 288} \\
& \mathrm{C}_{\mathbf{O}_{2}}=\mathbf{0 . 0 0 9 6 5 \mathbf { ~ k g } \text { mole } / \mathbf { m } ^ { 3 }} \\
& \mathrm{C}_{\mathrm{N}_{2}}=\frac{\mathrm{P}_{\mathrm{N}_{2}}}{\mathrm{R}_{\mathrm{o}} \mathrm{~T}}=\frac{0.79 \times 1.1 \times 10^{4}}{8314 \times 288} \\
& \mathrm{C}_{\mathrm{N}_{2}}=\mathbf{0 . 0 3 6 3 \mathbf { ~ k g ~ m o l e } / \mathbf { m } ^ { 3 }}
\end{aligned}
$$

2. To find mass densities ( $p_{o_{2}}$ and $p_{N_{2}}$ )

$$
\boldsymbol{P}=\mathbf{M C}
$$

Where, M: Molecular weight

$$
\begin{aligned}
\mathrm{P}_{\mathrm{o}_{2}}= & \mathrm{M}_{\mathrm{o}_{2}} \times \mathrm{C}_{\mathrm{o}_{2}}=32 \times 0.00965 \\
& \mathbf{P}_{\mathbf{o}_{2}}=\mathbf{0 . 3 0 9} \mathbf{~ k g} / \mathbf{m}^{3} \\
\mathrm{P}_{\mathrm{N}_{2}}= & \mathrm{M}_{\mathrm{N}_{2}} \times \mathrm{C}_{\mathrm{N}_{2}}=28 \times 0.0363 \\
& \mathbf{P}_{\mathrm{N}_{2}}=\mathbf{1 . 0 1 6} \mathbf{~ k g} / \mathbf{m}^{3}
\end{aligned}
$$

3. To find mass fractions ( $M_{o_{2}}$ and $M_{N_{2}}$ )

We know that

$$
\begin{aligned}
& \rho=\rho_{o_{2}}+\rho_{N_{2}}=0.309+1.016 \\
& \boldsymbol{\rho}=\mathbf{1 . 3 7 5} \mathbf{k g} / \boldsymbol{m}^{\mathbf{3}} \\
& M_{o_{2}}=\frac{\rho_{o_{2}}}{\rho}=\frac{0.309}{1.325} \\
& \boldsymbol{M}_{\boldsymbol{o}_{\mathbf{2}}}=\mathbf{0 . 2 3 3}
\end{aligned}
$$

$$
\begin{aligned}
& \quad M_{N_{2}}=\frac{\rho_{N_{2}}}{\rho}=\frac{1.016}{1.325} \\
& \boldsymbol{M}_{N_{2}}=\mathbf{0 . 7 6 7}
\end{aligned}
$$

4. To find molar fraction ( $n_{o_{2}}$ and $n_{N_{2}}$ )

We know that

$$
\begin{gathered}
C=C_{o_{2}}+C_{N_{2}}=0.00965+0.0363 \\
C=1.375 \mathbf{k g} \text { mole} / \boldsymbol{m}^{\mathbf{3}} \\
n_{o_{2}}=\frac{C_{o_{2}}}{C}=\frac{0.00965}{0.046} \\
\boldsymbol{n}_{\boldsymbol{o}_{2}}=\mathbf{0 . 2 1} \\
n_{N_{2}}=\frac{C_{N_{2}}}{C}=\frac{0.0363}{0.046} \\
\boldsymbol{n}_{N_{2}}=\mathbf{0 . 7 9}
\end{gathered}
$$

6. A counter flow heat exchanger is employed to $\operatorname{cool} 0.55 \mathrm{~kg} / \mathrm{s}\left(\mathrm{C}_{\mathrm{p}}=2.45 \mathrm{kj} / \mathrm{kg}^{\circ} \mathrm{C}\right)$ of oil from $115^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}$ by the use of water. The inlet and outlet temperature of cooling water are $15^{\circ} \mathrm{C}$ and $75^{\circ} \mathrm{C}$ respectively. The overall heat transfer coefficient is expected to be $1450 \mathrm{~W} / \mathrm{m}^{20} \mathrm{C}$.

Using NTU method, calculate the following:
(i) The mass flow rate of water.
(ii) The effectiveness of heat exchanger.
(iii) The surface area required.

## Given:

Counter flow HE

$$
\begin{aligned}
\mathrm{M}_{\mathrm{h}} & =0.55 \mathrm{~kg} / \mathrm{s} \\
C_{p_{h}} & =2.45 \mathrm{kj} / \mathrm{kg}{ }^{\circ} \mathrm{C} \\
\mathrm{~T}_{1} & =115^{\circ} \mathrm{C} \\
\mathrm{~T}_{2} & =40^{\circ} \mathrm{C} \\
\mathrm{t}_{1} & =15^{\circ} \mathrm{C} \\
\mathrm{t}_{2} & =75^{\circ} \mathrm{C} \\
\mathrm{U} & =1450 \mathrm{~W} / \mathrm{m}^{20} \mathrm{C}
\end{aligned}
$$

## To find:

1.The mass flow rate of water. $\left(\mathrm{m}_{\mathrm{c}}\right)$
2.The effectiveness of heat exchanger. ( $($ )
3.The surface area required.(A)

## Solution:

For $\in-N T U$ method from HMT date book

$$
\mathbf{Q}=\epsilon \mathbf{C}_{\min }\left(\mathbf{T}_{\mathbf{1}}-\mathbf{t}_{\mathbf{1}}\right)
$$

To find $\mathrm{m}_{\mathrm{c}}$
Use energy balance equation.
Heat lost by hot fluid $=$ Heat gained by cold fluid

$$
\begin{aligned}
& \mathrm{m}_{\mathrm{h}} \mathrm{C}_{\mathrm{p}_{\mathrm{h}}}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)=\mathrm{m}_{\mathrm{c}} \mathrm{C}_{\mathrm{p}_{\mathrm{c}}}\left(\mathrm{t}_{2}-\mathrm{t}_{1}\right) \\
& 0.55 \times 2450(115-40)=\mathrm{m}_{\mathrm{c}} \times 4186(75-15) \\
& \mathbf{m}_{\mathbf{c}}=\mathbf{0 . 4 0} \mathbf{k g} / \mathbf{s}
\end{aligned}
$$

Heat capacity rate of hot fluid $=C_{h}=m_{h}-C_{p_{h}}$

$$
\begin{gathered}
=0.55 \times 2.45 \\
\mathrm{C}_{\mathrm{h}}=1.35 \mathrm{kw} / \mathrm{K}
\end{gathered}
$$

Heat capacity rate of cold fluid $=\mathrm{C}_{\mathrm{c}}=\mathrm{m}_{\mathrm{c}}-\mathrm{C}_{\mathrm{p}_{\mathrm{c}}}$

$$
=0.40 \times 4.186
$$

$$
\mathrm{C}_{\mathrm{c}}=1.67 \mathrm{kw} / \mathrm{K}
$$

$$
\begin{aligned}
& \mathrm{C}_{\mathrm{h}}<\mathrm{C}_{\mathrm{c}} \\
& \mathrm{C}_{\mathrm{h}}=\mathrm{C}_{\text {min }}
\end{aligned}
$$

$$
\epsilon=\frac{m_{h} C_{p_{h}\left(T_{1}-T_{2}\right)}}{C_{\min ( }\left(T_{1}-T_{2}\right)}
$$

$$
=\frac{115-40}{115-15}
$$

$$
\epsilon=0.75=75 \%
$$

$$
\mathrm{Q}=0.75 \times 1350(115-15)
$$

$$
Q=101.250 W
$$

$\mathrm{Q}=\mathrm{UA}(\Delta \mathrm{T})_{\mathrm{lm}}$

$$
\mathbf{A}=\mathbf{Q} / \mathbf{U}(\Delta \mathbf{T})_{\mathrm{Im}}
$$

$$
(\Delta \mathrm{T})_{\operatorname{lm}}=\frac{\left(T_{1}-t_{2}\right)-\left(T_{2}-t_{1}\right)}{\ln \left[\frac{\left.T_{1}-t_{2}\right)}{\left(T_{2}-t_{1}\right)}\right]}
$$

$$
=\frac{(115-75)-(40-15)}{\ln \left[\frac{115-75}{40-15}\right]}
$$

$$
(\Delta T)_{\mathrm{lm}}=31.9^{\circ} \mathrm{C}
$$

$$
\begin{aligned}
\mathrm{A} & =\frac{101.250}{1450 \times 31.9} \\
\mathbf{A} & =\mathbf{2 . 1 9} \mathbf{~ m}^{\mathbf{2}}
\end{aligned}
$$

7. A pan of $\mathbf{4 0} \mathbf{~ m m}$ deep, is filled with water to a level of $\mathbf{2 0} \mathbf{~ m m}$ and is exposed to dry air at $30^{0}$ C. Calculate the time required for all the water to evaporate. Take, mass diffusivity is $0.25 \times 10^{-4} \mathrm{~m}^{2} / \mathrm{s}$.

Given:
Deep, $\left(\mathrm{x}_{2}-\mathrm{x}_{1}\right)=40-20=20 \mathrm{~mm}=0.020 \mathrm{~m}$
Temperature, $\mathrm{T}=30^{\circ} \mathrm{C}+273=303 \mathrm{~K}$
Diffusion co- efficient , $\mathrm{D}_{\mathrm{ab}}=0.25 \times 10^{-4} \mathrm{~m}^{2} / \mathrm{s}$.

## To find:

Time required for all the water to evaporate, t .

## Solution:

We know that, for isothermal evaporation
Molar flux,$\frac{m_{a}}{A}=\frac{D_{a b}}{G T} \frac{p}{\left(x_{2}-x_{1}\right)} \times \ln \left[\frac{p-p_{w 2}}{p-p_{w 1}}\right]$
Where,

$$
\begin{aligned}
& \mathrm{G} \text { - Universal gas constant }=8314 \mathrm{j} / \mathrm{kg}-\text { mole- } \mathrm{K} \\
& \mathrm{P}-\text { Total pressure }=1 \mathrm{~atm}=1.013 \mathrm{bar}=1.013 \times 10^{5}
\end{aligned}
$$

$\mathrm{N} / \mathrm{m}^{2}$
$\mathrm{p}_{\mathrm{w} 1} \quad-\quad$ Partial pressure at the bottom of the pan
Corresponding to saturation temperature $30^{\circ} \mathrm{C}$
At $30^{\circ} \mathrm{C}$

$$
\begin{array}{llll}
\Rightarrow & \mathrm{p}_{\mathrm{w} 1} \quad= & 0.04242 \mathrm{bar} & \text { (From steal table page no.2) } \\
\Rightarrow & \mathrm{p}_{\mathrm{w} 1}= & \\
\hline
\end{array}
$$

$\mathrm{P}_{\mathrm{w} 2}$ - partial pressure at the top of the pan, which is zero.
(1)

$$
\begin{aligned}
& \Rightarrow \quad \mathrm{P}_{\mathrm{w} 2}=0 \\
& \Rightarrow \quad \frac{m_{a}}{A}=\quad \frac{0.25 \times 10^{-4}}{8314 \times 303} \times \frac{1.013 \times 10^{5}}{0.020} \times\left[\frac{1.013 \times 10^{5}-0}{1.013 \times 10^{5}-0.04242 \times 10^{5}}\right] \\
& \frac{m_{a}}{A} \quad=\quad 2.15 \times 10^{-6} \frac{\mathrm{~kg}-\text { mole }}{\mathrm{s}}
\end{aligned}
$$

For unit Area, $\mathrm{A}=1 \mathrm{~m}^{2}$
Molar rate of water, $\mathrm{m}_{\mathrm{a}}=2.15 \times 10^{-6} \frac{\mathrm{~kg}-\text { mole }}{\mathrm{sm}^{2}}$
We know that,

Mass Rate of $=\quad$\begin{tabular}{c}
Molar Rate of <br>
water vapour <br>
water vapour

$\times \quad$

Molecular weight <br>
of steam
\end{tabular}

$$
=2.15 \times 10^{-6} \times 18.016
$$

Molar rate of water vapour $\quad=3.87 \times 10^{-5} \mathrm{~kg} / \mathrm{s}-\mathrm{m}^{2}$
The total amount of water to be evaporated per $\mathrm{m}^{2}$ area

$$
\begin{aligned}
& =(0.20 \times 1) \times 1000 \\
& =20 \mathrm{~kg} / \mathrm{m}^{2} \text { Area }
\end{aligned}
$$

Time required, $t \quad=\quad \frac{20}{\text { Massrate of water vapour }}$

$$
=\frac{20}{3.87 \times 10^{3} s}
$$

## Result :

Time required for all the water to evaporate, $t=516.79 \times 10^{3} \mathrm{~S}$
8. A heat exchanger is to be designed to condense an organic vapour at a rate of $\mathbf{5 0 0}$ $\mathbf{k g} / \mathrm{min}$. Which is available at its saturation temperature of 355 K . Cooling water at 286 $K$ is available at a flow rate of $\mathbf{6 0 ~ k g} / \mathrm{s}$. The overall heat transfer coefficient is $\mathbf{4 7 5}$ $\mathbf{W} / \mathbf{m}^{2} \mathrm{C}$ Latent heat of condensation of the organic vapour is $\mathbf{6 0 0} \mathbf{~ k J} / \mathrm{kg}$. Calculate

1. The number of tubes required, if tubes of 25 mm otuer diameter, 2 mm thick and 4.87 m long are available, and
2. The number of tube passes, if cooling water velocity (tube side) should not exceed $2 \mathrm{~m} / \mathrm{s}$.

Given:

$$
\begin{aligned}
\mathrm{d}_{\mathrm{o}} & =25 \mathrm{~mm}=0.025 \\
\mathrm{~d}_{\mathrm{i}} & =25-(2 \times 2)=21 \mathrm{~mm}=0.21 \mathrm{~m} \\
\mathrm{~L} & =4.87 \mathrm{~m} \\
\mathrm{~V} & =2 \mathrm{~m} / \mathrm{s} \\
\mathrm{~T}_{\mathrm{c} 1} & =286-273=13^{\circ} \mathrm{C} \\
\mathrm{~T}_{\mathrm{sat}} & =\mathrm{T}_{\mathrm{h} 1}=\quad \mathrm{T}_{\mathrm{h} 2}=355-273=82^{\circ} \mathrm{C} \\
\mathrm{U} & =475 / \mathrm{m}^{2} \mathrm{~K} \\
\mathrm{~h}_{f g} & =600 \mathrm{kj} / \mathrm{kg} \\
\mathrm{~m}_{\mathrm{h}} & =\frac{500}{60}=8.33 \mathrm{~kg} / \mathrm{s} \\
\mathrm{~m}_{\mathrm{c}} & =60 \mathrm{~kg} / \mathrm{s}
\end{aligned}
$$

Find
(i) Number of tubes (N)
(ii) Number of tube passes (P)

## Solution

$\mathrm{Q} \quad=\quad \mathrm{UA} \theta_{\mathrm{m}}=\mathrm{U}\left(\pi \mathrm{d}_{0} \mathrm{LN}\right) \theta \mathrm{m}$
$\mathrm{Q} \quad=\quad \mathrm{m}_{\mathrm{h}} \mathrm{h}_{\mathrm{fg}}=\mathrm{m}_{\mathrm{c}} \mathrm{C}_{\mathrm{pc}}\left(\mathrm{T}_{\mathrm{c} 2}-\mathrm{T}_{\mathrm{c} 1}\right)$
i.e. Heat lost by vapour = heat gained by ater

$$
\begin{aligned}
& Q=8.33 \times 600 \times 10^{3} \\
& \begin{aligned}
Q=m_{c} c_{p v}\left(T_{c 2}-T_{c 1}\right) & \\
8.33 \times 600 \times 10^{3} & =60 \times 4.18\left(\mathrm{~T}_{\mathrm{c} 2}-13\right) \\
\mathrm{T}_{\mathrm{c} 2} & =32.9^{\circ} \mathrm{C} \\
\therefore \theta_{m} & =\frac{\theta_{1}-\theta_{2}}{\ln \left(\frac{\theta_{1}}{\theta_{2}}\right)} \\
\theta_{m} & =\frac{\left(T_{h 1}-T_{c 1}\right)-\left(T_{h 2}-T_{c 2}\right)}{\ln \left(\frac{\left(T_{h 1}-T_{c 1}\right)}{\left(T_{h 2}-T_{c 2}\right)}\right)} \\
& =\frac{(82-13)-(82-32.9)}{\ln \left(\frac{(82-13)}{(82-32.9)}\right)} \\
\theta_{m} & =58.5^{\circ} \mathrm{C}
\end{aligned}
\end{aligned}
$$

Heat transfer rate is given by

$$
\begin{aligned}
Q & =m_{h} h_{f g}=U A \theta_{m} \\
8.33 \times 600 \times 10^{3} & =475 \times(\pi \times 0.025 \times 4.87 \times \mathrm{N} \times 58.5) \\
\mathrm{N} & =470 \text { Tubes }
\end{aligned}
$$

To find N . of tube passes ( P )

$$
\mathrm{N}=\mathrm{P} \times \mathrm{N}_{\mathrm{p}}
$$

Where

| N | $:$ | No. of tubes |
| :--- | :--- | :--- |
| P | $:$ | No. of tube passes |
| $\mathrm{N}_{\mathrm{p}}$ | $:$ | No. of tubes in each pass |

i.e. The cold water flow passing through each pass.

$$
\begin{aligned}
& m_{c}=A V_{p} N_{p} \\
& 60=\frac{\pi}{4} d i^{2} V_{\rho} \times N_{p} \\
& 60=\frac{\pi}{4}(0.021)^{2} \times 2 \times 1000 \times N_{p} \\
& \mathrm{~N}_{\mathrm{p}}=95.5
\end{aligned}
$$

We know that

$$
\mathrm{N}=\mathrm{P} \times \mathrm{N}_{\mathrm{p}}
$$

$\therefore$ No. of passes $(\mathrm{P})=\frac{N}{N_{p}}$

$$
\begin{aligned}
& =\frac{470}{95.5}=4.91 \\
\mathbf{P} & =\mathbf{5}
\end{aligned}
$$

$\therefore$ Number of passes $(P)=5$
9. An Open pan 20 cm in diameter and 8 cm deep contains water at $25^{\circ} \mathrm{C}$ and is exposed to dry atmospheric air. If the rate of diffusion of water vapour is $8.54 \times 10^{-4} \mathrm{~kg} / \mathrm{h}$, estimate the diffusion co-efficient of water in air.

## Given

Diameter d $=20 \mathrm{~cm} \quad=0.20 \mathrm{~m}$
Length $\left(\mathrm{x}_{2}-\mathrm{x}_{1}\right)=8 \mathrm{~cm} \quad=0.08 \mathrm{~m}$
Temperature , $\mathrm{T}=25^{\circ} \mathrm{C}+273=298 \mathrm{~K}$
Diffusion rate (or)
Mass rate of water vapour

$$
\begin{aligned}
& =\quad 8.54 \times 10^{-4} \mathrm{~kg} / \mathrm{h} \\
& =\quad \frac{8.54 \times 10^{-4} \mathrm{~kg}}{3600 \mathrm{~s}} \\
& =\quad 2.37 \times 10^{-7} \mathrm{~kg} / \mathrm{s}
\end{aligned}
$$

## To find

Diffusion co-efficient, $\mathrm{D}_{\mathrm{ab}}$
Solution
We know that
Molar rate of water vapour

$$
\begin{array}{r}
\frac{m_{a}}{A}=\frac{D_{a b}}{G T} \frac{p}{\left(x_{2}-x_{1}\right)} \times \ln \left[\frac{p-p_{w 2}}{p-p_{w 1}}\right] \\
\Rightarrow m_{a}=\frac{D_{a b}}{G T} \frac{p}{\left(x_{2}-x_{1}\right)} \times \ln \left[\frac{p-p_{w 2}}{p-p_{w 1}}\right]
\end{array}
$$

We know that,
Mass rate of water vapour $=$ Molar rate of water vapour + Molecular weight of steam

$$
\begin{equation*}
2.37 \times 10^{-7}=\frac{D_{a b}}{G T} \frac{p}{\left(x_{2}-x_{1}\right)} \times \ln \left[\frac{p-p_{w 2}}{p-p_{w 1}}\right] \times 18.016 \tag{1}
\end{equation*}
$$

where,

$$
\text { Area, A }=\frac{\pi}{4} d^{2}
$$

$$
=\quad \frac{\pi}{4}(0.20)^{2}
$$

$$
\mathrm{A}=0.0314 \mathrm{~m}^{2}
$$

G - Universal gas constant $=8314 \frac{J}{\mathrm{~kg}-\text { mole }-K}$
p- $\quad$ Total pressure $=1 \mathrm{~atm}=1.013$ bar
$=\quad 1.013 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$
$\mathrm{p}_{\mathrm{wl}}=$ Partial pressure at the bottom of the test tube corresponding to saturation temperature $25^{\circ} \mathrm{C}$
At $25^{\circ} \mathrm{C}$
$\Rightarrow \mathrm{p}_{\mathrm{wl}}=0.03166$ bar $\quad$ [From (R.S. Khurami) Steam table, Page no.2]
$\Rightarrow \mathrm{p}_{\mathrm{wl}}=0.03166 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$
$\mathrm{p}_{\mathrm{w} 2} \quad$ - Partial pressure at the top of the pan. Here, air is dry and there is no water vapour. So, pw2-0.
$\Rightarrow \mathrm{p}_{\mathrm{w} 2}=0$
(1) $2.37 \times 10^{-7}=$

$$
\frac{D_{a b} \times 0.0314}{8314 \times 298} \times \frac{1.013 \times 10^{5}}{0.08} \times \operatorname{in}\left[\frac{1.013 \times 10^{5}-0}{1.013 \times 10^{5}-0.03166 \times 10^{5}}\right] \times 18.016
$$

$$
\mathrm{D}_{\mathrm{ab}}=2.58 \times 10^{-5} \mathrm{~m}^{2} / \mathrm{s}
$$

## Result:

Diffusion co-efficient, $\mathrm{D}_{\mathrm{ab}}=2.58 \times 10^{-5} \mathrm{~m}^{2} / \mathrm{s}$.
10. A counter flow double pipe heat exchanger using super heated steam is used to heat water at the rate of $10500 \mathrm{~kg} / \mathrm{hr}$. The steam enters the heat exchanger at $180^{\circ} \mathrm{C}$ and leaves at $130^{\circ} \mathrm{C}$. The inlet and exit temperature of water are $30^{\circ} \mathrm{C}$ and $80^{\circ} \mathrm{C}$ respectively. If the overall heat transfer coefficient from steam to water is $814 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}$, calculate the heat transfer area. What would be the increase in area if the fluid flow were parallel?

## Given

Counter flow heat exchanger

$$
\begin{aligned}
& \dot{m}_{w}=\dot{m}_{c}=\frac{10500}{3600}=2.917 \mathrm{~kg} / \mathrm{s} \\
& \mathrm{~T}_{1}=180^{\circ} \mathrm{C} \quad \mathrm{t}_{1}=30^{\circ} \mathrm{C} \\
& \mathrm{~T}_{2}=130^{\circ} \mathrm{C} \quad \mathrm{t}_{2}=80^{\circ} \mathrm{C} \\
& \mathrm{U}=814 \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}
\end{aligned}
$$

## Find

(i) Area of heat transfer (A)
(ii) Increase in area

## Solution

(i) When the flow is counter:

$$
\begin{aligned}
& \theta_{m}=\frac{\theta_{1}-\theta_{2}}{\ln \left(\theta_{1} / \theta_{2}\right)} \\
& \theta_{1}=T_{1}-t_{2}=180-80=100^{\circ} \mathrm{C} \\
& \theta_{2}=T_{2}-t_{1}=130-30=100^{\circ} \mathrm{C} \\
& \text { LMTD }=0^{\circ} \mathrm{C}
\end{aligned}
$$

If LMTD $=0{ }^{\circ} \mathrm{C}$ use AMTD
So, $\mathrm{AMTD}=\frac{\theta_{1}+\theta_{2}}{2} \quad$ [AMTD: Arithmetic mean temperature difference]

$$
\begin{aligned}
\text { AMTD } & =\frac{100+100}{2} \\
\text { AMTD } & =100^{\circ} \mathrm{C} \\
\theta_{\mathrm{m}} & =100^{\circ} \mathrm{C}
\end{aligned}
$$

Here $\quad \Delta \mathrm{T}_{\mathrm{lm}}=\mathrm{AMTD}$
$\therefore$ To find heat transfer rate

$$
\mathrm{Q}=\dot{m}_{c} c_{p c}\left(t_{2}-t_{1}\right)
$$

$$
\mathrm{Q}=2.917 \times 4.187 \times 10^{3}(80-90)
$$

$2.917 \times 4.187 \times 10^{3} \times 50=814 \times \mathrm{A} \times 100$

$$
\mathrm{A}=7.5 \mathrm{~m}^{2}
$$

ii) When the flow is parallel

$$
\begin{gathered}
\Delta T_{l m}=\frac{\left(T_{1}-t_{1}\right)-\left(T_{2}-t_{2}\right)}{\ln \left[\left(\left(T_{1}-t_{1}\right) /\left(T_{2}-t_{2}\right)\right)\right]} \\
=\frac{(180-30)-(130-80)}{\ln [(180-30) /(130-80)]}
\end{gathered}
$$

$$
\begin{gathered}
